MOA

MEMORANDUM OF AGREEMENT
AMONG
THE FEDERAL RAILROAD ADMINISTRATION,
THE NATIONAL RAILROAD PASSENGER CORPORATION (AMTRAK),
THE NEW JERSEY TRANSIT CORPORATION (NJ TRANSIT)
AND
THE NEW JERSEY HISTORIC PRESERVATION OFFICER
REGARDING THE
PORTAL BRIDGE CAPACITY ENHANCEMENT PROJECT
IN HUDSON COUNTY, NEW JERSEY

WHEREAS, the National Railroad Passenger Corporation ("Amtrak") and the New Jersey Transit Corporation ("NJ TRANSIT"), the project sponsors, are proposing capacity enhancements to the Hackensack River crossing of the Northeast Corridor currently consisting of the Portal Bridge (the "Project");

WHEREAS, The Federal Railroad Administration ("FRA") is the Project's lead federal agency pursuant to the National Environmental Policy Act (NEPA, codified at 42 USC 4321 et seq.) and is the federal agency responsible for compliance with Section 106 of the National Historic Preservation Act (codified at 16 USC § 470f, and herein "Section 106");

WHEREAS, FRA, Amtrak, and NJ TRANSIT, along with the New Jersey Historic Preservation Office ("NJHPO"), as the result of a consultative process in accordance with Section 106, have determined that it is appropriate to enter into this Memorandum of Agreement or "Agreement," pursuant to Section 800.6 of the regulations implementing Section 106 (codified at 36 CFR Part 800, and herein the "Section 106 Regulations"), which will govern the implementation of the Project and satisfy FRA's compliance with Section 106;

WHEREAS, FRA has coordinated its compliance with Section 106 and NEPA, pursuant to 36 CFR § 800.8 through its preparation of an Environmental Impact Statement ("EIS") for the Project;

WHEREAS, through the process conducted in preparing the EIS, FRA has determined that the Project will have an effect on properties qualifying for protection under Section 106, consisting of certain properties listed or eligible for listing on the New Jersey State and National Registers of Historic Places ("Historic Properties");

WHEREAS, pursuant to the Section 106 Regulations, FRA and NJ TRANSIT, in consultation with NJHPO, identified the Project's areas of potential effect ("APEs") for Historic Properties and determined that the APEs are the areas where potential effects on Historic Properties caused by the Project may occur;

WHEREAS, as documented in the EIS, FRA, and NJ TRANSIT, in consultation with NJHPO, identified eight Historic Properties in the Project's APEs that qualify for Section 106 protection. These Historic Properties are identified in Table 5.2-1 of the EIS, "Historic Properties within Study Area." Additionally, Figure 5.2-3 of the EIS depicts the approximate locations of these Historic Properties. These figures are annexed hereto as Exhibit A;

WHEREAS, as documented by the EIS, FRA, and NJ TRANSIT, in consultation with NJHPO, identified one area with the potential to contain Archaeological Properties in the Project's archaeological APE ("archaeologically sensitive area"): the State/National Register-eligible Historic Cemeteries of

Hudson County (a.k.a. Hudson County Potter's Field Burial Ground [New Jersey State Museum #28-Hd-30, LBG]) archaeological site, which has the potential to contain human remains. This location is shown on Figure 5.2-2 of the EIS, annexed hereto as Exhibit B;

WHEREAS, as documented in the EIS, the Project is expected to have an adverse effect on two Historic Properties, the New Jersey (State) Register (SR)-listed and National Register (NR)-eligible Portal Bridge, and the State/National Register-eligible Pennsylvania Railroad Historic District. A mitigation plan for the Portal Bridge and the Pennsylvania Railroad Historic District to partially mitigate adverse effects is included in this Memorandum of Agreement;

WHEREAS, the EIS demonstrated that the Project construction could have additional potential adverse effects on certain Historic Properties primarily due to the proximity of the resources to proposed construction activities. Historic Properties that the EIS identified as being in proximity to project construction to require protection under the Construction Protection Plan include Substation 4 (S/NR-eligible) and the Jersey City Waterworks Pipeline (S/NR-eligible);

WHEREAS, the proposed Project is not expected to have an adverse effect on the former Edison Battery Company Property (S/NR-eligible), however, other projects concurrently planned by other entities may adversely affect the complex in the future, and could constitute a cumulative effect of the Project which the proposed Project might contribute to;

WHEREAS, FRA has made a reasonable and good faith effort to identify and contact by letter the appropriate Native American tribes and groups (the "Tribes") that could attach religious or cultural significance to sites within the APEs upon which the Project could have an effect;

WHEREAS, notwithstanding certain federal laws which exempt Amtrak from state and local regulation, due to the involvement of NJ TRANSIT, an instrumentality of the State of New Jersey, the Project is subject to the New Jersey Register of Historic Places Act of 1970 (New Jersey Administrative Code [N.J.A.C.] 7:4). The project may result in a physical effect on the SR-listed Portal Bridge, and therefore, NJTRANSIT will need to secure Project Authorization as per the stipulations of the New Jersey Register of Historic Places Act;

NOW, THEREFORE, FRA, Amtrak, NJ TRANSIT, and NJHPO agree that the Project shall be implemented in accordance with the following stipulations to ensure that potential effects on Historic Properties are taken into account.

STIPULATIONS

FRA, AMTRAK, NJ TRANSIT, AND NJHPO AGREE THAT THE FOLLOWING STEPS WILL BE UNDERTAKEN IN CONNECTION WITH THE PROJECT AND THAT FRA WILL INCLUDE THE OBLIGATIONS SET FORTH IN THIS AGREEMENT AS PART OF ITS RECORD OF DECISION AND AS A CONDITION OF FRA'S APPROVAL OF ANY GRANT ISSUED FOR CONSTRUCTION OF THE PROJECT, TO ENSURE THAT THESE MEASURES ARE IMPLEMENTED AS PART OF THE COMPLIANCE WITH THE SECTION 106 PROCESS AND THE SUBSEQUENT PLANNING, DESIGN, AND CONSTRUCTION OF ANY APPROVED PROJECT ALTERNATIVE.

I. MITIGATION OF UNAVOIDABLE ADVERSE EFFECTS

Mitigation for potential adverse effects on the Portal Bridge (SR-listed; NR-eligible) and the Pennsylvania Railroad Historic District (S/NR-eligible) would be developed by Amtrak and NJ TRANSIT in consultation with FRA and NJHPO and would include the following:

A. Historic American Engineering Record (HAER) documentation of Portal Bridge and the portion of the Pennsylvania Railroad Historic District within the APE. HAER documentation will include narratives that describe in detail the physical characteristics of the structures (including their engineering, design and setting), and that interpret their history, focusing on their construction as part of the first direct rail route between New York City and New Jersey which did not rely on ferry transport and which also involved the construction of New York's Pennsylvania Station. Primary and secondary resources will be used in the research effort, including historic engineering literature, United States Army Corps of Engineers Reports, the files of Amtrak and NJ TRANSIT, newspapers and periodicals, and the collections of libraries, historical societies, and other repositories in New York and New Jersey, such as the New York Public Library, the City Hall Library, the Municipal Archives, and other locations. The compiled information, which could include historic plans, photographs, and other documents, will be duplicated to appropriate archival standards as part of the recordation document. The HAER recordation would also include photographic documentation, which would record both the Portal Bridge and the portions of the Pennsylvania Railroad within the APE. Photographs, prints, and duplicates would be meet appropriate HAER archival standards. Both still photography and video footage would illustrate the moveable span of the Portal Bridge in operation.

A draft copy of the report and accompanying materials would be submitted to NJHPO for review and comment. Final copies of the recordation document will be provided to the NJHPO, the Rutgers University Special Collections Library, and county and local archives, as appropriate.

B. Salvage of elements of Portal Bridge and/or Pennsylvania Railroad Historic District, such as truss components, tracks, etc. NJ TRANSIT and Amtrak will develop a list of potentially salvageable items for review and comment by NJHPO. NJ TRANSIT and Amtrak will also develop a marketing plan for review by NJHPO which will be in effect for the duration of one year.

C. Development of an interpretive exhibit in a park, greenway, or public space that would present the history of the Pennsylvania Railroad and Portal Bridge and possibly include salvaged elements of the resources, signage, etc. The location, format, and content of this exhibit will be identified by Amtrak and NJ TRANSIT in consultation with NJHPO.

D. Additional documentation interpreting the history and significance of the Portal Bridge and Pennsylvania Railroad in the form of a website, to be developed and maintained by NJ TRANSIT in

consultation with Amtrak and FRA, and to be completed in coordination with the NJHPO. The website may include written narratives, historic and recent photography, and video of the operating bridge. The location, format, and specific content of the website will be determined in consultation with NJHPO.

II. DESIGN REVIEW

Amtrak and NJ TRANSIT in coordination with FRA shall ensure that the preliminary and final plans and specifications for the proposed new bridge adhere to the recommended approaches in the Secretary of the Interior's Standards and Treatments for Historic Properties and are compatible with the historic and engineering features of the Portal Bridge and the Pennsylvania Railroad Historic District.

Upon completion of the Project's Design Criteria Report during preliminary engineering, NJ TRANSIT and Amtrak would consult with the NJHPO to identify engineering constraints and opportunities for incorporating historically compatible design into the preliminary plan. Amtrak and NJ TRANSIT shall consult with NJHPO in the development of bridge plans at the preliminary (30%) and pre-final (approximately 75%) design stages. NJHPO will respond within 30 calendar days of receipt by the NJHPO at each stage of completion as described above. Amtrak and NJ TRANSIT will consider and respond to all comments received from NJHPO. If NJHPO does not respond within the comment period, Amtrak and NJ TRANSIT may assume that NJHPO concurs with the submitted plans.

III. CONSTRUCTION PROTECTION PLAN

To avoid Project-related construction damage to any Historic Property, Amtrak and NJ TRANSIT, in consultation with FRA and NJHPO, will develop a Construction Protection Plan for Historic Properties. The Construction Protection Plan, developed prior to construction of the Project, would set forth the specific measures to be used, and specifications that would be applied, to protect Historic Properties during the construction period. Amtrak and NJ TRANSIT shall ensure that Historic Properties that could be adversely affected by the Project construction will be included in a Construction Protection Plan, and Amtrak and NJ TRANSIT shall implement such plan as appropriate. NJ TRANSIT and Amtrak will proceed with implementation of the plan upon NJHPO's review and approval of the Construction Protection Plan.

IV. ADDITIONAL EVALUATION FOR HISTORIC CEMETERIES OF HUDSON COUNTY AREA OF ARCHAEOLOGICAL SENSITIVITY

A. Further Impact Analyses

A number of previous archaeological surveys have been carried out in sections of the Historic Cemeteries of Hudson County, including the Potter's Field Disinterment/Re-interment Project (Louis Berger Group, 2005) and the Access to the Region's Core (ARC) EIS; Phase 1A Archaeological Documentary Study (TransitLink Consultants, 2005). Ground-Penetrating Radar studies were conducted in associated with the ARC project (Geo-Graf Geophysical Investigations, 2007) that identified anomalies (potential burial sites) in a water-inundated section of the archaeological APE. Based on the conclusions of these previous archaeological surveys, as project engineering proceeds, the vertical and horizontal extents of proposed project construction will be compared to archaeologically sensitive areas to determine potential Project effects.

B. Field Testing

If further impact analyses described in II.A.1 determine that the Project may affect areas sensitive for archaeological resources associated with the Historic Cemeteries of Hudson County, Amtrak and NJ TRANSIT, in consultation with FRA and NJHPO, shall undertake field testing to identify the presence or absence of such resources:

1. Prior to commencing any field testing, Amtrak and NJ TRANSIT shall submit a Field Testing Plan outlining the proposed methodology for NJHPO's concurrence. In areas identified as potentially sensitive for human remains, field testing to determine presence or absence of burials will proceed in a sensitive manner, in accordance with requirements for testing in areas potentially sensitive for human remains to be established in the Field Testing Plan, to be completed by Amtrak and NJ TRANSIT in consultation with FRA and NJHPO. Mechanical equipment would be used in field testing only to remove the overburden and to expose soils to a point where grave shafts would be discernable. If grave shafts are discernable, excavation of a sample grave shaft would proceed by hand in order to confirm the presence of human remains. If human remains are found, they would be left in situ and the shaft would be refilled.

2. If archaeological testing is planned in inundated areas requiring dewatering, NJ TRANSIT and Amtrak would obtain a permit from the New Jersey Department of Environmental Protection (NJDEP) and other appropriate agencies.

3. Subsurface work will only be undertaken in areas potentially sensitive for human remains following the prior notification of and opportunity for consultation with any interested lineal descendents of the deceased buried in the Historic Cemeteries of Hudson County (if any such descendants can be reasonably identified and located) as outlined below in III.C.

4. A physical anthropologist/forensic archaeologist shall either be on-call or on-site, as determined in the Field Testing Plan developed in consultation with NJHPO, in the event that skeletal material is encountered during archaeological testing or Project construction in or adjacent to the archaeologically sensitive area;

5. Subsequent to field testing in areas sensitive for human remains, Amtrak and NJ TRANSIT shall provide a technical report to FRA and NJHPO in which one of the following conclusions is reached:

   (i) The site does not appear to contain materials relating to the Historic Cemeteries of Hudson County; in which case no further action is required.

   (ii) The site does appear to contain materials relating to the Historic Cemeteries of Hudson County, in which case the site will be treated in accordance with II.A.3 below.

6. NJHPO's review and comment on such reports shall be governed by the process set forth in III.A-B.

C. Disinterment/Re-interment of Human Remains

If field testing determines that human remains exist in areas that will be impacted by the Project, Amtrak and NJ TRANSIT would implement a Disinterment/Re-interment Plan in coordination with FRA, NJHPO, and any interested lineal descendents of the deceased buried in the Historic Cemeteries of Hudson County, as set forth below.

1. Amtrak and NJ TRANSIT would prepare a Disinterment/Re-interment Plan in consultation with FRA, NJHPO, and any interested lineal descendents of the deceased buried in Historic Cemeteries of Hudson County. The Disinterment/Re-interment Plan would be prepared to conform to the Secretary of the Interior's Standards for Archaeological Documentation by an archaeologist that satisfies the qualifications specified in 36 CFR 61, Appendix A. The Disinterment/Re-interment Plan would be developed and implemented so as to avoid and minimize construction delays, and in conformance with the following requirements.

2. Where subsurface work is required, Amtrak and NJ TRANSIT shall make a reasonable and good faith effort, prior to any excavation to disinter remains, to locate and contact any lineal descendents of the deceased buried in the Historic Cemeteries of Hudson County. In the event that interested lineal descendent(s) have been identified and located, Amtrak and NJ TRANSIT shall seek the involvement of the descendants to establish an appropriate protocol outlining appropriate notification procedures and treatment of human remains during disinterment and re-interment.

3. The Historic Cemeteries of Hudson County fall within the jurisdiction of the New Jersey Cemetery Act, Title 8A for the New Jersey Statutes (N.J.S.) (State of New Jersey 2002). The New Jersey Cemetery Board administers the Act, and the New Jersey Attorney General oversees actions and proceedings of the Cemetery Board. Any disinterment and re-interment would also require approval by the Chancery Division of the Superior Court of New Jersey. The landowner of the affected portion of the Historic Cemeteries of Hudson County would have to initiate legal proceedings seeking approval from the Court for any disinterment and re-interment. The Cemetery Board, the State of New Jersey, and interested lineal descendents of the deceased (if applicable) would be defendants in the litigation. A hearing before the Court would be required to approve the Disinterment/Re-interment Plan. Any required legal processes could be carried out in advance of final design, to avoid or minimize schedule delays.

4. A physical anthropologist/forensic archaeologist shall be on-site during disinterment.

5. Once Amtrak and NJ TRANSIT, in consultation with FRA and NJHPO, determine that all remains have been properly exhumed, construction may proceed.

6. Within two years after the completion of disinterment and re-interment, Amtrak and NJ TRANSIT shall provide a technical report to FRA and NJHPO. FRA and NJHPO's review and comment on such submissions shall be governed by the process set forth in III.A-B.

D. Mitigation Data Recovery, Curation, and Public Interpretation

1. Amtrak, NJ TRANSIT, and FRA, in consultation with NJHPO, shall consider measures, such as design modification, for avoidance of the Historic Cemeteries of Hudson County area of archaeological sensitivity.

2. In advance of any mitigation or data recovery efforts undertaken for the Historic Cemeteries of Hudson County, Amtrak and NJ TRANSIT, in consultation with NJHPO, will develop in accordance with 36 CFR Part 79, an Analysis and Curation of Material and Records Plan for any archaeological excavations. NJHPO's review and comment on such plans shall be governed by the process set forth in III.A-B. Amtrak and NJ TRANSIT shall be responsible for the implementation of such a plan, as appropriate.

3. During and/or following mitigation or data recovery efforts, Amtrak and NJ TRANSIT will consult with NJHPO as to the appropriateness of creating and providing interpretive materials to the public. If appropriate, Amtrak and NJ TRANSIT will develop a Public Outreach Plan for Archaeology which would be submitted to NJHPO for review and comment. Such materials could take the form of a brochure, information kiosk, or web page to provide information on the data recovery program and any archaeological resources uncovered as a result of that program. Amtrak and NJ TRANSIT will implement the final Public Outreach Plan for Archaeology, as appropriate.

E. Unanticipated Discoveries Plan

Amtrak and NJ TRANSIT in consultation with FRA shall develop and implement an Unanticipated Discoveries Plan for human and non-human archaeological resources in the event that any unanticipated archaeological resources are encountered during construction of the Project. The Unanticipated Discoveries Plan would be submitted to NJHPO for review and comment.

F. Construction and Archaeology Phasing Plan

Amtrak and NJ TRANSIT will take all practical steps to initiate and complete archaeological field analysis and data recovery, as necessary (depending on site access and testing feasibility), prior to construction activities in the vicinity of affected resources. Amtrak and NJ TRANSIT in consultation with NJHPO, will develop a plan to appropriately phase the archaeological field analysis and data recovery with construction activities. NJHPO's review and comment on such plans shall be governed by the process set forth in III.A-B.

G. Professional Standards

Amtrak and NJ TRANSIT shall ensure that all archaeological research, testing, analysis, and plans conducted pursuant to this Agreement are carried out by or under the direct supervision of a person or persons meeting at a minimum the Secretary of Interior's Professional Qualifications Standards for archaeology. Amtrak and NJ TRANSIT shall ensure that all final reports are consistent with the NJHPO's *Guidelines for Preparing Cultural Resources Management Archaeological Reports Submitted to the Historic Preservation Office* and the Department of the Interior's *Standards for Archaeological Documentation.*

V. COMPLIANCE WITH NEW JERSEY REGISTER OF HISTORIC PLACES ACT

Because the Project could result in a physical effect to an SR-listed property (the Portal Bridge), NJ TRANSIT will submit an Application for Project Authorization to the NJHPO pursuant to the New Jersey Register of Historic Places Act (N.J.A.C. 7:4). NJ TRANSIT, in coordination with Amtrak, FRA, and NJHPO, will also fulfill any additional compliance obligations stipulated in N.J.A.C. 7:4-7 ("Review Procedures for Projects Encroaching upon New Jersey Register Properties"), as appropriate.

VI. IDENTIFICATION OF ADDITIONAL BUILT PROPERTIES AND ASSESSMENT OF PROJECT EFFECTS

A. If additional Historic Properties not previously identified as Historic Properties in the EIS are identified in the Project's APEs during Preliminary Engineering, Final Design, or Construction of the Project, the potential effects on Historic Properties will be assessed prior to construction by FRA, Amtrak, and NJ TRANSIT, in consultation with NJHPO, in accordance with the Section 106 process. NJHPO review will be carried out in compliance with the stipulations of VII, Document Review.

B. If construction activities or Project plans change such that the Project may newly affect an archaeologically sensitive area, Amtrak, NJ TRANSIT, and FRA shall notify NJHPO and invite NJHPO to participate in consultation to determine the appropriate course of action.

C. If it is determined that concurrently planned projects would adversely affect the S/NR-eligible former Edison Battery Company Property, and if it is determined that the effects of the proposed Project contribute to a cumulative adverse effect on the Property, Amtrak and NJ TRANSIT would consult with FRA and NJHPO to develop appropriate mitigation measures, if appropriate.

VII. DOCUMENT REVIEW

NJHPO shall provide comments regarding any future plans and/or amendments to such plans as promptly as possible but not to exceed 30 calendar days of its receipt of such plans or reports. If NJHPO does not submit comments in writing to FRA, Amtrak, and NJ TRANSIT within 30 calendar days of receipt of any such submissions, it is understood that NJHPO has concurred with the proposed plans. If NJHPO objects in writing within 30 calendar days of its receipt of any submissions, then FRA, Amtrak, NJ TRANSIT, and NJHPO shall consult expeditiously in an effort to resolve the objection. If FRA, Amtrak, and NJ TRANSIT cannot resolve NJHPO's objection and if further consultation with NJHPO is deemed unproductive by any party, then the parties shall adhere to the dispute resolution procedures detailed under VII. below.

VIII. REPORTING AND OVERSIGHT

A. Final Reports. Amtrak and NJ TRANSIT shall ensure that all final historic reports and all final archaeological resources reports resulting from this Agreement shall be provided to NJHPO and FRA.

B. Annual Reports. Commencing one year from the date this Agreement is fully executed, and every year thereafter until the Project is completed or terminated, annual reports will be submitted by Amtrak and NJ TRANSIT to NJHPO and FRA, providing information

concerning the implementation of this Agreement and the effect of the Project on Historic Properties.

C. Annual Review of the Agreement. The signatories to this Agreement, or their successors, will review the implementation of this Agreement and determine whether revisions are needed at the time the annual reports are submitted.

D. Revisions to the Agreement. After review of the annual reports, if FRA, Amtrak, NJ TRANSIT, and NJHPO, or their successors in interest all agree that revisions to this Agreement are necessary, such revisions will be considered and implemented pursuant to a consultative process involving all the parties to this Agreement.

IX. DISPUTE RESOLUTION

In the event NJHPO objects in writing to any plan or report proposed pursuant to this Agreement within 30 calendar days of its receipt of such plan or report, FRA, Amtrak, and NJ TRANSIT shall meet with NJHPO to resolve the objection. Following such further consultation, FRA shall determine as promptly as possible whether such objection has been satisfactorily resolved. If FRA determines that the objection has not been satisfactorily resolved, within 15 calendar days of its determination in this regard, FRA shall forward all documentation relevant to the dispute, including FRA's proposed resolution of the dispute, to ACHP. ACHP will provide FRA with recommendations or comments within 30 calendar days after receipt of all pertinent documentation. FRA will take such recommendations or comments into account in reaching a final decision regarding the dispute. In the event ACHP fails to respond to FRA's request for recommendations or comments within 30 calendar days of receiving all pertinent documents, FRA may resolve the dispute.

X. OTHER

A. Notwithstanding any other provision in this Agreement, any party may propose an amendment hereto whereupon the parties will consult to consider such amendments.

B. For purposes of notices and consulting pursuant to this Agreement, the following addresses and contact information should be used for the following agencies:

A. CULTURAL RESOURCES BACKGROUND HISTORY

PREHISTORIC CONTEXT

INTRODUCTION

Archaeologists have divided the time between the arrival of the first humans in northeastern North America and the arrival of Europeans more than 10,000 years later into three prehistoric periods: Paleo-Indian (12,500-10,000 years before present [BP]), Archaic (10,000-2,700 BP), and Woodland (2,700 BP–AD 1500). These divisions are based on certain changes in environmental conditions, technological advancements, and cultural adaptations, which are observable in the archaeological record. With the exploration and settlement of the New Jersey region by Europeans from 1500 to 1700 AD (the Contact Period), the Native American population experienced a period of greatly accelerated change and stress.

PALEO-INDIAN PERIOD (12,500-10,000 BP)

Human populations did not inhabit the area that is now modern New Jersey until approximately 12,500 BP, after the glaciers retreated as early as 13,000 to 14,000 BP (Lenik 1999). These new occupants included Native American populations referred to as Paleo-Indians, who were present in the area long before the Munsee, a branch of the Delaware or Lenape Native Americans would inhabit the parts of present-day New York, New Jersey, Pennsylvania, Delaware, and Maryland in later years (Grumet 1981).

The Paleo-Indians most likely exploited a wide variety of resources provided by their environment. It has been suggested that they did not only actively hunt the large mammals that roamed about the region (mammoths, mastodons, etc.), but they also hunted and trapped smaller animals and supplemented their diet with fish and gathered plants (Cantwell and Wall 2001).

There was a very distinctive Paleo-Indian style of lithic technology, typified by skillfully crafted stone tools, such as fluted projectile points used for hunting. They were often made of high-quality chert, and other lithic materials. Other stone tools manufactured at this time included knives, scrapers, drills, and gravers. Wood, ivory, and other materials were also used for the manufacture of composite tools, such as hunting spears.

Archaeological evidence suggests that the Paleo-Indians were likely highly mobile hunters and gatherers who lived in small groups of fewer than 50 individuals (Dincauze 2000) and did not maintain permanent campsites. In addition, most of the Paleo-Indian sites that have been investigated were located near water sources.

It is because of the close proximity of Paleo-Indian sites to the coastline that so few of them have been preserved in New Jersey and neighboring coastal states. It is thought that most sites

dating to this period are now submerged as a result of rising sea levels caused by melting glaciers (TLC 2005). Of the few Paleo-Indian sites that have been found in the region, nearly all have been found on Staten Island. Port Mobil, in southwestern Staten Island, is located on high ground overlooking the Arthur Kill waterway. Due to heavy disturbance in the area, the site has yielded only a small collection of fluted points and other stone tools characteristic of the period. Paleo-Indian sites were also found along the eroding shoreline 500 yards south of the Port Mobil site, and at the Cutting site in the Rossville section of Staten Island (AKRF 2006).

ARCHAIC PERIOD (10,000-2,700 BP)

The Archaic has been sub-divided into three chronological segments, based on trends identified in the archaeological record which reflect not only the ecological transformations that occurred during the Archaic, but the cultural changes as well. These have been termed the Early Archaic (10,000–8,000 BP), the Middle Archaic (8,000–6,000 BP) and the Late Archaic (6,000–2,700 BP) (Cantwell and Wall 2001). The Late Archaic is sometimes further divided to include the Terminal Archaic period (3,000-2,700 BP).

The aforementioned environmental transformations included the continued post-glacial warming trend, the extension of hardwood forests from the south, and a decrease in glacial runoff which resulted in the creation of lakes and other small bodies of water. There was a subsequent migration of new animal and plant species into the area, while the herds of large mammals traveled north, eventually dying out. The new surroundings attracted smaller animals, such as rabbit, turkey, waterfowl, and white-tailed deer.

As the Archaic progressed and the number of plant and animal species inhabiting the area increased, the size of the human population did as well. In general, archaeologists have shown that Archaic Native American sites were most often located near water sources. The abundance of food resources which arose during this period allowed the Archaic Native Americans to occupy individual sites on a permanent or semi-permanent basis, unlike their nomadic Paleo-Indian predecessors. These individuals migrated on a seasonal basis within specific territories and consistently returned to and reoccupied the same sites.

The arrival of new food sources allowed the human population to expand their subsistence strategies, but at the same time forced them to develop different technologies that would allow such resources to be exploited. Perhaps the most important of these developments was the advent of fishing technology, which occurred during the Middle Archaic in response to an increasing dependence on the area's marine resources. The new technology included stone hooks and net sinkers. In addition, the influx of nut- and seed-bearing foliage resulted in the development of stone mortars and pestles as well as stone axes, used to process plant material.

In order to successfully hunt the smaller game animals that had established themselves in the region, narrower spear points and knives were manufactured, along with weighted spear throwers. Domestic technology was advanced as well, with the development of a wider variety of hide scrapers and, later in the period, the origin of bowls made from steatite or soapstone. Tools continued to be crafted in part from foreign lithic materials, indicating that there was consistent trade among Archaic Native American groups from various regions in North America throughout the Archaic.

Due in part to rising sea levels and to the recent rapid development of the area (Boesch 1994), few Early Archaic sites have been identified in New Jersey and New York (TLC 2005: 40). Most of those that have been identified in the area are located on Staten Island, including Ward's

Point, Richmond Hill, the H.F. Hollowell site, and the Old Place site. Sites such as Ward's Point- a domestic habitation location which due to rising sea levels was originally inland- tend to be deep and stratified and have yielded stone tools related to cooking, woodworking, and hide processing. The many years of constant occupation caused the artifacts to be deeply buried under more recent debris deposits (Cantwell and Wall 2001). However, at the Old Place Site, the only artifacts discovered, stone tool assemblages, were found at relatively shallow depths of around 42 inches (Ritchie 1980).

An Early Archaic site, the Black Creek Site, was identified in the 1990s in the Vernon Valley in Sussex County, northwestern New Jersey. The site is located on a 40-acre peninsular landform within a post-glacial lake bed. Over 15,000 artifacts ranging from the Early Archaic to the Contact Period were recovered including stone tools, projectile points, and pottery sherds.

Few Middle Archaic sites in the region have been found. The majority of those that have been identified consist of large shell middens, which are often found near major water courses such as the Hudson River, although stone points have also been found in such locations.

Unlike Early and Middle Archaic sites, many Late and Terminal Archaic sites have been found in the region. Late Archaic habitation sites are often found in areas of low elevation near water courses and temporary hunting sites are often located near sandy areas. Multiple Late Archaic sites have been found on Staten Island, including the Pottery Farm, Bowman's Brook, Wort Farm, and Arlington Avenue sites, among others (Boesch 1994).

WOODLAND PERIOD (2,700 BP-AD 1500)

The Woodland period represents a cultural revolution of sorts for the Northeast. During this time, Native Americans began to alter their way of life, focusing on a settled, agricultural lifestyle rather than one of nomadic hunting and gathering. Social rituals begin to become visible in the archaeological record at this time. There have been many elaborate human and canine burial sites identified from this period. The first evidence of smoking has also been found—stone pipes have been uncovered at Woodland sites—and it was at this time that pottery began to be produced.

In general, there was a greater emphasis placed on composite tools during the Woodland period. While stone scrapers, knives, and hammerstones were still in use, there was an increased use of bone, shell, and wood in tool making. Furthermore, the development of bows and arrows revolutionized hunting practices. Fishing continued to be important to the local economy and wooden boats and bone hooks were often utilized (Historical Perspectives, Inc. 2005). Many tools were still made from imported materials, indicating that the trade networks established earlier were still being maintained (Cantwell and Wall 2001).

Pottery was introduced into Native American society early in the Woodland period and by the time of European contact in the 1500s, well-crafted and elaborately decorated pottery was being manufactured. Like the Archaic period, the Woodland has been divided into Early, Middle, and Late sections, which differ mostly based on the style of pottery which was produced at that time. Woodland pottery had simple beginnings; the first examples were coil pots with pointed bases, which were made with grit temper. These were replaced during the Middle Woodland period by shell-tempered vessels bearing a variety of stamped and imprinted decorations. As the period drew to a close, the decorative aspect of the pottery was further augmented with the addition of intricate ornamental rims (LBG 2004).

Woodland-era sites across North America indicate that there was an overall shift toward full-time agriculture and permanently settled villages. However, Archaic sites in New York City indicate that the Native Americans there continued to hunt and forage on a part-time basis. This was most likely due to the incredibly diverse environmental niches that could be found across the region throughout the Woodland period and it is possible that the Native Americans residing across the river in New Jersey exhibited similar behavioral patterns (Cantwell and Wall 2001, Grumet 1995). Nevertheless, Woodland societies were considerably more sedentary than were their predecessors. There was, however, some farming of maize, beans, squash, and tobacco. The development of pottery, increasingly complex burial sites, and the presence of domesticated dogs are all consistent with sedentary societies, which have a close association with a particular territory or piece of land.

Woodland sites, like those of the Paleo-Indian and Archaic periods, are usually found alongside water courses. They were often occupied for long periods of time, although there was still some seasonal migration that may have left them unoccupied for brief periods throughout the year.

Two possible Woodland-period sites were identified within two miles of the archaeological APE. These were identified by Dr. William L. Pyle in 1936, and have been recorded in the New Jersey State Museum site files as site numbers 26-Hd-7 and 26-Hd-8 respectively. The sites were located in Jersey City. Site No. 26-Hd-7 was described as being at the foot of the lake and north of the knoll in Lincoln Park, Jersey City. It was identified as a village or camp site located near a former spring. Pyle collected over 50 artifacts from the site, including projectile points, axes, pipes, and knives, with a date range estimated at 300 to 3,000 years BP. Site No. 26-Hd-8 was located at the foot of Williams, Boyd, Virginia, and Ege Avenues, south of Lincoln Park, in Jersey City, near the Hackensack River. Little information was recorded regarding this site.

CONTACT PERIOD (AD 1500-1700)

The Woodland period ended with the arrival of the first Europeans in the early 1500s. At that time, a division of the Munsee Indians known as the Hackensack Indians resided in the vicinity of the project area (Grumet 1981). The Hackensack have been described as "a numerous as well as a war-like group" whose territory extended as far inland as the Passaic River (Bolton 1975: 58). The group was friendly with their neighbors; the Raritan to the southeast and the Tappan to the north. It is possible that they shared their lands as far south as Staten Island with the latter group (Ibid).

Giovanni de Verazzano was the first European to view New York in 1524. However, Henry Hudson's expedition to New York in 1609 marked the true beginning of European occupation in the area, and subsequently marked the beginning of violent encounters with the Native Americans. Shortly after Hudson's men explored Staten Island and northern New Jersey (Lenik 1999), a skirmish ensued with the local Indians, resulting in the death of one of Hudson's crewmen.

Because of this incident, the Native Americans in the region were extremely wary of Europeans. The first attempt at a permanent settlement in the area was known as "Pavonia," located on the neck of land east of Newark Bay, in the vicinity of the modern towns of Jersey City and Bayonne; southeast of the project area. The land was granted in 1629 by the Dutch West India Company (WIC) to Michael Pauw (Paauw) (Stokes 1967). After five years of hostile encounters with the local Native Americans, he sold it back to the WIC for 26,000 guilders (Ibid). Although several Dutch farmers lived in the area in the 1630s and 1640s, as seen on the Manatus Map of

1639**,** a successful permanent settlement was not established until 1660, when Bergen Village, near today's Jersey City, was founded (Lenik 1999).

Native Americans at first maintained the village sites they had established near water sources. As their trade with European settlers intensified, they became increasingly sedentary and the way of life once maintained by the Native Americans was thoroughly and rapidly altered. European guns, cloth, kettles, glass beads, and alcohol soon became incorporated into the Native American economy. While at first the Natives traded furs and pelts in exchange for European goods, maize (corn) quickly became an important commodity. Most Lenape groups grew corn at the sites of their permanent habitation sites as well as at seasonal campsites and soon Europeans began to rely on Native American agriculture (Becker 1999). Soon, maize began to "stabilize" the Native American economy and was a major factor in the increased sedentary behavior of local Indian tribes (Becker 1999: 45).

However, once the Europeans became more self-sufficient, and maize was no longer an important commodity, the Native American economy dwindled (Lenik 1999). In addition, the Native Americans suffered from the side-effects of European colonization: disease, alcoholism, and warfare. Fierce wars soon broke out between the Dutch and the Indians. This was most intense during the early 1640s when Dutch Director-General William Kieft ordered many ferocious and unprovoked attacks on the Native population. One of the more vicious attacks at this time occurred in 1643, when after a Dutch man was murdered by a Native American at the Pavonia settlement, the Dutch slaughtered a village of Native American refugees, including many Hackensack, in the middle of the night (Grumet 1981). While Kieft's war with the Indians continued in other parts of New Amsterdam, the Hackensack signed peace treaties in both 1643 and 1645 (Ibid).

The warfare was somewhat abated when Kieft was replaced by Peter Stuyvesant, who brought some stability to the area. However, the Native Americans were no match for the growing numbers of armed European settlers. With their populations quickly decreasing and the European demand for land increasing, the natives began to sell off their land in greater quantities. As land in the New York City region was sold to the Europeans, many displaced Native Americans joined the Hackensack in northern New Jersey. By 1700, the Hackensack and Tappan tribes had each been forced to retreat to the "upper reaches of the Hackensack and Passaic Rivers" until they had "virtually merged" (Grumet 1981: 13). They occupied the highland areas of northern New Jersey until the mid-18th century, at which time they were gradually forced further and further west (Grumet 1981: 13).

Multiple Contact-period archaeological sites have been identified in the region. Alanson Skinner and Max Schrabisch, in their 1913 report of archaeological sites in New Jersey, recorded 11 Native American fish weirs (traps) in the Passaic River (Lutins and DeCondo, 1999). Of these 11 weirs, the Fair Lawn/Paterson Fish Weir is still extant. Lutins and DeCondo, who investigated the structure in 1999, described it as a V-shaped stone wall constructed of boulders and river cobbles, spanning the entire width of the Passaic River (roughly 260 feet) north of the Fair Lawn Avenue Bridge near the city of Paterson.

HISTORIC-PERIOD CONTEXT

MEADOWLANDS LAND USE HISTORY

'The Meadowlands' refers to the tidal and freshwater wetlands surrounding the Hackensack and Passaic Rivers in northeastern New Jersey. A state geological survey in 1896 calculated the total

area covered by the Meadowlands as roughly 43 square miles from Hackensack to Elizabeth. The southern portion of the Meadowlands on the west side of Newark Bay was historically known as the Newark Meadows; while the remaining portion was known as the Hackensack Meadows. Today, much of the Meadowlands has been converted to dry upland, and only roughly 13 square miles of wetland remain.

The changing nature of the Meadowlands was brought about in part by environmental factors: a sharp rise in salinity over the last 200 years, for example, has occurred in part due to rising sea levels. However, human activities have also played a major role in the history and the physical decline of the Meadowlands. Human activities directly affecting the Meadowlands include: the extraction of natural resources; the alteration of water flow; land reclamation, land making, and development; and pollution by sewage, trash, or industrial waste. These uses have occurred, to varying degrees, from prior to European Contact through the present.

From the pre-Contact period through the late 19th century, inhabitants used the Meadowlands as a source of shellfish, fish, foul, and other game. Newark Bay was famous for oysters, receiving seed oysters from the south and west to replenish stocks as they dwindled in the mid-19th century (NJ/NY Baykeeper 2006). From the 1660s through the 1920s, settlers cultivated and harvested salt hay in the area. Salt hay, used for livestock feed and bedding and as a packing material, was the basis of an important industry (Teal 1969: 40). “The founders of Newark introduced the practice of dividing the Meadowlands into long, narrow lots, which were allocated to the male heads of households. Owners were required to excavate small ditches (six feet wide and two feet deep) to identify property boundaries” (Marshall 2004: 7). Typically, salt hay was cut in autumn using scythes, and was harvested using rakes, pitchforks, and horses when the ground froze in winter. During the last quarter of the 19th century, harvesting fish and game from the Meadowlands was curtailed due to pollution and diminishing water flow. Salt hay production ceased in the early 20th century as regional agricultural patterns shifted and new materials were substituted.

Early settlers also exploited the Atlantic white cedar forests that once occupied large tracts of the Meadowlands, including the Hackensack riverfront in Kearny. The wood of the trees, which reached up to sixty feet tall, was extremely rot-resistant, and was ideal for boatbuilding, road construction, and shingle manufacture. During the 18th century, most of the country’s roofing shingles were made from New Jersey Meadowlands cedar. Not only were live trees were extensively harvested, but buried fallen trees, sometimes several hundred years old, were “mined” from the below water-level in the preserving swamps (Sloane 1965: 15). By the late 18th century, the cedar forests in the Meadowlands had been all but decimated by the heavy lumbering, and while minor resurgences of growth occurred in later years, Atlantic white cedars no longer grow in the area. However, the stumps of the former forests are visible at low tide in certain portions of the Meadowlands (Sullivan 1998: 41).

The Hackensack and Passaic rivers were originally fresh enough in many locations that cattle could drink from them. A shift towards salinity over the course of the 19th and 20th centuries was brought about in part by numerous engineered projects that involved altering the rivers’ course. Construction of dams to create mill ponds, occurring as early as the late 1600s, diverted fresh water and diminished its presence in the Meadowlands. In the 1860s, the Hackensack Water Company began to construct a system of wells, pumping stations, and reservoirs along the Hackensack River to supply water to the cities of Hoboken, Weehawken, and Hackensack. In the early 20th century, larger-scale dams were constructed in the Hackensack River watershed as the local population expanded and required increased water supply. Also during the second half of

the 19th century, the Jersey City Waterworks ran a pipeline between Kearny and Jersey City (located below ground in roughly the same location as the Belleville Turnpike within the APE, crossing the Hackensack River south of the APE near the PATH river crossing [Bien & Vermule, 1891]). Many of the geographic features referenced in this chapter can be found in Figure 3-1.

In 1845, the mouth of the Hackensack River was 10 to 18 feet deep. Dredging performed in the river in the late 19th century and channelization and dredging in the early 20th century, have resulted in a current depth of 32 feet for the first three miles of the river; 25 feet for the next quarter mile; and 15 feet for an additional half mile. The channel varies in width between 200 and 800 feet.

The Meadowlands' shift from a brackish and freshwater wetland to a primarily salt water wetland has also resulted in a change of plant life in the area over the last two centuries. *Phragmites* have been replaced by *Spartina*; and cedar trees, which once forested large stretches of the Meadowlands, have all but disappeared from the area due to their intolerance to salinity.

Until the late 20th century, the Meadowlands were seen primarily in a negative light, as an unhealthy and largely unproductive wasteland, unusable for agriculture or development.

Many miles of the Meadowlands have been transformed to dry upland as a direct result of human engineering, including both land reclamation (accomplished either through construction of dikes and drains) and land making (involving the deposition of fill material on wetlands). Nineteenth century projects were mainly limited to land reclamation: drained wetlands were located below the high tide line, and were intended for development as farm land rather than residential or industrial use. The earliest known land reclamation efforts in the Meadowlands were carried out by the Swartout family from the 1820s to the 1840s. Later, in the 1860s, engineer Spencer B. Driggs and developer Samuel Pike employed cutting edge methods, involving water pumps, tidal gates, and iron-plated dikes, to reclaim land in the same area. The iron dikes installed as part of these projects are still intact in some locations, and are visible within the Kearny APE along the Hackensack River (Sullivan 1998: 51). In the late 19th century, several similar land reclamation projects were spearheaded by Newark businessmen, politicians, and developers.

In the 20th century, a more costly method of land making became popular, using fill to elevate made land above the water level, thus allowing its use for industrial, commercial, or residential purposes. "Some of the fill would be obtained by dredging navigational channels in nearby rivers and bays. Other sources of fill were municipal garbage and excavation debris from the construction of tunnels, skyscraper foundations, and subways" (Marshall 2004: 11). Among the major land-makers and developers in the Meadowlands was the New Jersey Terminal Dock and Land Improvement Company, which used New York City garbage and excavation debris from the trans-Hudson tunnels to fill over five square miles of wetland between the Hackensack and Passaic rivers.

The populations of New York City, Newark, and Hudson County, each more than doubled between 1870 and 1900. Suburbanization resulted in demand for residential development sites including newly constructed riverfront land in the Meadowlands. Large-scale commercial/industrial projects also occurred, particularly in the Newark Meadows (the southernmost portion of the Meadowlands), including Port Newark in the 1910s, Newark Airport in the 1920s, and the New Jersey Turnpike, in the early 1950s. The New Jersey Turnpike's interchange at Route 3 transformed the small town of Secaucus into a city, and

spurred the development of large commercial facilities; as well as the 700-acre Meadowlands Sports Complex constructed across the Hackensack River from Secaucus in the late 1960s.

In addition to land making and reclamation activities, refuse dumping and industrial waste deposition have also had a major impact on the Meadowlands. Sewage from nearby towns and industrial waste began to result in pollution of the Passaic and Hackensack Rivers in the mid-19th century. Dredging and land making projects, already discussed, also released pollutants into the wetlands. Several open dumps and sanitary landfills also existed in the Meadowlands in the mid-20th century; and illegal dumping also occurred on a large scale.

In 1968, the Hackensack Meadowlands Development Act was enacted by the New Jersey Legislature, intended to prevent illegal dumping. A year later, the Hackensack Meadowlands Development Commission was founded. The initial purpose of the group was to oversee planning and development, and to regulate garbage disposal. By the 1970s, conservation of the Meadowlands had become a more popular cause, and the Hackensack Meadowlands Development Commission (which changed its name to the New Jersey Meadowlands Commission in 2001) focused its efforts on remediation and protection of the remaining wetlands.

GENERAL HISTORY OF THE KEARNY AREA

The area now occupied by the 'West Hudson' towns of Kearny and Harrison, was called Meghgecticock by the Hackensack Indians and was named New Barbadoes Neck after Chief Tantaqua deeded much of the area to Captain William Sanford of Barbados in 1668. A high ridge or 'riser' running north-south between the Hackensack and Passaic rivers was a favored location for settlement, while the marshy lands flanking the rivers were largely undeveloped.

Copper was discovered in the area in 1719, which gave impetus to settlement and construction of new roads. Schuyler Road, now part of Belleville Turnpike, which intersects the APE, was laid out during this period as a route on which to cart copper ore to boats on the Passaic River. The Newark Plank Road, which runs east-west across the lower Kearny meadowlands (south of the APE) was built around 1765 (Stinson 1920: 362).

Arent Schuyler (1662-1730), an Albany merchant and military man, the son of Dutch pioneers, built an elaborate estate on the west shore of the Passaic River near the town of Belleville ca. 1710. Schuyler's grandson of the same name established a copper mine in the 1760s, importing a steam engine from England and hiring an engineer. The copper mine, located on the ridge in northern Kearny, overlooking the Meadowlands, has been considered the first regularly operated mine in America, as well as the first steam-powered mine. The Schuyler Mansion figured prominently in the Revolutionary War, and served as headquarters for British troops under Sir Henry Clinton during an important raiding operation.

In 1825, New Barbados Neck was officially renamed Lodi in commemoration of Napoleon's victory in that northern Italian town in 1796. In 1840 the name was changed again, to Harrison, in honor of President William Henry Harrison. In 1867, the town of Kearny separated from the town of Harrison; it was named after General Philip Kearny, a commander in the Mexican and Civil wars. Kearny had established an ostentatious estate in the area, which he called Belle Grove, in 1853-6. He was killed at Chantilly while leading forces during the Civil War. The name of Arlington was given to the northern section of the town of Kearny, situated on a rocky ridge above the Passaic River; the 'borough' of Arlington was named after Arlington Heights, Virginia, famous for its high elevation.

The vicinity of the APE in Kearny remained largely undeveloped, with the exception of the roads and railroads that traversed it, through most of the 19th century. Much of the Kearny meadowlands were part of the Samuel Pike estate until around 1900. Until that time, "the entire meadow tract was left as nature made it, the only exception being the two or three boat houses which had sprung up adjacent to the railroad bridges crossing the Hackensack River," just south of the APE (Stinson 1915: 370).

A wealth of anecdotal accounts in newspapers and local histories suggests that the Meadowlands in both Kearny and Secaucus was the site of river pirate camps from the colonial period through the early 19th century. River pirates harassed the ships and docks of New York City and New Jersey, stealing boats and ships' cargos and engaging in smuggling operations. The river pirates' best known camps included the Fourth Ward of Manhattan, the Meadowlands near Bayonne, and the cedar swamps adjacent to Snake Hill in Kearny: "The pirates evidently had a well-provided camp secreted in the tract of the Kearny meadows somewhere opposite Snake Hill which they reached by means of a tidal creek or stream" (Stinson 1915: 369). This may refer either to a former inlet called Dead Horse Creek located on what is now the Diamond Shamrock property in the APE; or to Saw Mill Creek, just north of the APE. Histories relate more than one altercation between the river pirates and local volunteers, who sought to quash the threat to trade and commerce. A local history tells of one occasion in the early 19th century when over a thousand volunteers cooperated in flushing the river pirates from camps along the Hackensack River from Point-no-Point (the southernmost point of the Kearny meadows) to Hackensack. The history refers to the "slaughter of the party of volunteers opposite Snake Hill" as "probably one of the most tragic incidents in the fifty years' period following the Revolution, if not indeed the most tragic in its history" (Stinson 1915: 368). On another occasion, the Kearny meadows near the bend in the Hackensack River were set on fire to destroy the river pirate camps.

Despite the undeveloped nature of the low-lying marshes, Kearny's location between the burgeoning cities of Newark and Jersey City, increasingly made the township a convenient location for residence, industry, and commerce. The Hackensack and Passaic rivers provided transportation opportunities, as did the multiple turnpikes, plank roads, and railroads that traversed the area.

In 1874, the Montclair and Greenwood Lake Railroad, between Montclair and Jersey City, was completed, running through Kearny. The construction of this railroad, which became a branch of the Erie Railroad in the 1880s, has been said to mark "the real beginning of modern Kearny" (Stinson 1915: 370). The borough of Arlington grew in popularity as a place for the wealthy to establish country estates.

During the last quarter of the 19th century, the Kearny meadowlands experienced rapid industrial development due in part to new transportation routes and advances in land-making technology. Multiple textile and floor-covering mills were established in Kearny during the 1880s and 1890s, and the town's population exploded during this period, largely with immigrants from England and Scotland. The population continued to increase in the early twentieth century, rising from 18,659 to 26,724 between 1910 and 1920 (Stinson 1915: 361). Kearny's downtown area was located east of Midland Avenue (west of the APE).

GENERAL HISTORY OF THE SECAUCUS AREA

Secaucus is located on the east bank of the Hackensack River, west of the cities of Jersey City, Hoboken, and Union City. These cities trace their origins to the 17th century; however, Secaucus itself remained sparsely settled throughout the 18th century. Several large estates or plantations

were located in the area in the 18th century, however, including those of Pinhorne and Eickbe, near Snake Hill.

Snake Hill (also known as Laurel Hill), located in the southwest corner of Secaucus (within the APE) is a large igneous rock intrusion, over 150 feet tall. Snake Hill was reportedly held sacred by the Hackensack Indians that inhabited the area in the Colonial period. Its name is a translation of the Indian name for the feature, and was given due to the large number of large black water snakes that occupied the hill and the surrounding marshes (Stinson 1915: 369).

In the late 1700s, Bergen County (of which Secaucus was then a part) located its Poor Farm in the vicinity of Snake Hill, on a 200-acre parcel that had been part of the Pinhorne estate. In the 1840s, Bergen County was divided into Passaic, Bergen, and Hudson counties. Secaucus became part of Hudson County, and the latter purchased the Poor Farm as the location of multiple Hudson County facilities, including an 'insane asylum,' penitentiary, almshouse, orphanage, several hospitals (including smallpox hospital, isolation hospital, children's eye infirmary, and tuberculosis hospital), county agricultural farm and piggery, and three cemeteries. The institutional complex began to decline in the 1930s. The asylum moved in 1927; the almshouse was converted into an old age home. The other institutions were put into other uses, including a boys camp, a unit for the Hudson Valley Fire Department, and for storage. Over the course of the late 20th century, the buildings once associated with the institutional complex were demolished. Currently, a smoke stack and remains of foundations and landscape features are the last standing vestiges of the complex (LBG 2005: 4-11).

The history of the cemeteries that were located on the Hudson County property has been detailed in two recent studies (LBG 2005; and TLC 2005). To summarize the results of these reports, the Historic Cemeteries of Hudson County at Snake Hill, also collectively known as the Snake Hill Cemetery or Laurel Hill Cemetery, were established in 1880. The burial grounds were used for the interment of the deceased from the institutional complex, unknown or unclaimed residents of Hudson County, and others. When the New Jersey Turnpike was constructed through the area in the early 1950s, the Turnpike Authority adjusted its construction methods in an attempt to minimize impacts to the burials, using a 190-foot bridge rather than an embankment to traverse the Snake Hill area. Burials to be impacted by the construction of the bridge abutments and three bridge piers were to be removed "and reburied in a 20x50-foot plot roughly 140 feet north-northeast of the then limits of the active burial ground" (LBG 2005: 2-1). Interment ceased in these cemeteries in 1962. The historic record does not provide the exact boundaries of the Historic Cemeteries of Hudson County , however, previous studies have created composite maps based on extensive archival research, which delineate those areas that may have been part of the cemeteries.

Snake Hill is said to be the inspiration for the Prudential 'Rock of Gibralter' logo, created by an advertising executive who passed the rock formation on a train in the 1890s. Portions of Snake Hill were blasted to make way for the New Jersey Turnpike (*NYT* 1950). The feature was further compromised by quarrying in the 1960s, which reduced Snake Hill's height by one quarter, and its base area by four-fifths (*NYT* 2002). The mineral Petersite was first identified at Snake Hill, when Nicholas Facciolla took a sample of the unknown substance to the Paterson Museum in 1981. Portions of Snake Hill and the former Hudson County institutional complex are now part of Laurel Hill County Park.

In 1900, Secaucus was formed as a borough by an act of the New Jersey State Legislature, and seventeen years later, the borough became a town. In the mid-20th century, the economy of Secaucus shifted from one based on pig farming, industry, and institutions, to one based on

transportation and suburban development. Secaucus is also the home of several corporate headquarters.

INDUSTRIAL HISTORY

Following the development of the first railroads through the area in the 1860s and 1870s, Kearny was transformed from undeveloped meadowlands, to a center of industry. The Mile End Thread Mills, Marshall Linen Thread Mills, and the Nairn Manufacturing Company, a linoleum factory, were among the large industries established in Kearny between the mid-1870s and the mid-1880s. Several of the largest Kearny mills had British proprietors, who recruited workers from England and Scotland. In contrast, workers for the industries of Arlington were primarily Swedes and Belgians, and the majority of those in the town of Harrison (west of Kearny) were Irish (Stinson 1915: 371).

The first industrial development (also the first non- road/railroad development to appear on historic maps) within the APE occurred along the Hackensack River, directly south of the Pennsylvania Railroad ROW. The Greenwood Lake Division and the Newark & Hudson Branch of the Erie Railroad ran through the industrial properties clustered in the area between the Pennsylvania Railroad/Northeast Corridor, the Morris & Essex Line (Delaware, Lackawanna, and Western Railroad), the Belleville Turnpike, and the Hackensack River.

The parcel located immediately south of the Northeast Corridor, now known as the Diamond Shamrock property, was first developed in 1916 by the Martin Dennis Company, which produced sodium bichromate and potassium dichromate, chemicals used in the preparation of 'Tanolin,' a leather tanning agent. A tidal inlet called Dead Horse Creek ran through the site in a northeast-southwest direction. A 1936 Sanborn map shows over a dozen buildings on the Martin Dennis property, limited to the south side of Dead Horse Creek, and clustered around the Greenwood Lake railroad tracks. The map also shows a dock on the Hackensack River south of the mouth of Dead Horse Creek (Sanborn 1936).

Also in 1916, the White Tar Company purchased a long narrow parcel directly south of the Diamond Shamrock property with a frontage on the Hackensack River. The company constructed several buildings on the site for the refinement of crude naphthalene for the production of moth repellents, disinfectants, and deodorizers. The Koppers Gas & Coke Company purchased the site in 1942, and continued production of naphthalene products (ATSDR 2005: 3). Immediately south of the parcel, the Thomas A. Edison Company purchased land in 1917 (*NYT* 1917). Buildings were not constructed on this site until the mid 1920s, when the company (Thomas A. Edison Company's subsidiaries, Edison Storage Battery Co. and Emark Battery Corp.) began production of batteries there. The Koppers Company purchased the Edison site and merged it with the parcel to the north to create the Tar Products Division-Meadows Plant. From 1959 to 1962, Tantanex Chemical Corp., producers of dye carriers, operated on the site. In 1962, the property was owned by Standard Chlorine and Standard Naphthalene companies.

Immediately south of the Standard Chlorine/Edison property, is the 175-acre property now known as the Koppers Seaboard property (Koppers Coke). Koppers Gas & Coke Company operated a coke plant and coal tar processing facility on this site from 1917 to 1971. During its peak, the plant produced 1.5 million tons of coke per year. Coal and coke storage facilities were concentrated on the southeast portion of the site (outside of the APE).

The buildings on the Koppers Seaboard parcel were demolished in 1976; today only one small building remains, located at the southern end of the site (outside of the APE). Diamond Shamrock also remained active until 1976. During the Viet Nam era, Agent Orange and other chemicals were produced on the site. In 1974, Dead Horse Creek was filled, and its mouth was blocked with a concrete barrier. Most of the buildings on the Diamond Shamrock site were demolished in 1978. Standard Chlorine remained in operation until 1993; buildings still remain standing on the property (ATSDR 2005: 1).

Across the Hackensack River in Secaucus, pig farms and horse rendering plants dominated the economy and the landscape. These 'nuisance industries,' gave Secaucus a reputation as one of the most malodorous locations in the region. By the mid-20th century, development was on the rise in the region, and pig farming quickly declined. When the New Jersey Turnpike and other roadways were built through the area, the government purchased many of the farms within the vicinity, and new transportation-related economies emerged. Additional farms were purchased for development as facilities such as the Meadowlands Sports Complex, and pig farming was much reduced in Secaucus by 1950.

TRANSPORTATION HISTORY

Transportation has been a major component of New Jersey's history since the colonial period due to its location between New York and Philadelphia and between New England and the southern states. New Jersey also supplied products and material to the nearby cities, and transportation infrastructure was important for the export of the grain, lumber, meat, and other regional exports. New Jersey's Atlantic coast, many navigable rivers, and low-lying land corridors made it possible for myriad transportation networks to develop, most of which were oriented in a northeast-southwest direction.

One of the earliest public roads in New Jersey, authorized by the State Legislature in 1765, ran from Newark across the Meadowlands (just south of the APE) to Paulus Hook (now a section of Jersey City) where a ferry connected with Manhattan. This road connected with the Brunswick-Trenton and Old York roads, collectively constituting a continuous overland route between the Hudson River and Philadelphia. In 1790, the Legislature appointed five commissioners to oversee the construction and maintenance of toll bridges across the Hackensack and Passaic rivers. Shareholders or 'proprietors' quickly formed a joint-stock company, and claimed a monopoly on building bridges near the mouths of the two rivers. The roadway was a success, multiple stage coach lines were established, and Newark's population grew swiftly, due to the ease of travel to New York (Lane 1939: 125).

The early 19th century was the turnpike era in New Jersey. These toll roads were generally established by municipalities in order to serve local or regional transportation and trade needs. The first charter for such a roadway was granted in 1801 for the Morris Turnpike, which connected the upper Delaware to Newark Bay, running through Elizabeth and Morristown. The Bergen Turnpike was chartered in 1802, making a shorter connection between Hackensack and the Hoboken ferry to New York. Another, the Newark Turnpike (which runs through the study area in Kearny) connected Newark and the Jersey City ferry at Paulus Hook. The Newark Turnpike was acquired by the bridge proprietors, and used the Hackensack River toll bridge.

Most turnpikes in New Jersey successfully provided returns to investors, particularly where monopolies existed; however, the success of the turnpikes waned with the competition of canals. The Morris Canal, which connected the upper Delaware with Newark and Jersey City in 1831 and the Delaware and Raritan Canal between Bordentown and Trenton, completed in 1834,

quickly superseded roadways as routes for the transport of goods, particularly anthracite coal from Pennsylvania (Lane 1939: 162).

Even more than canals, railroads came to dominate transportation in the region by the mid-19th century. New Jersey was at the forefront of railroad construction in the United States. A Hoboken resident and railroad advocate, John Stevens, procured the first charter for an American railroad from the New Jersey Legislature in 1815. In 1825, he constructed an experimental railroad in Hoboken; and five years later, he and his two sons built the Camden and Amboy Railroad and Transportation Company, between Camden and South Amboy (a connection to Trenton was completed in 1839). Soon after its establishment, the Camden and Amboy united with the Delaware and Raritan Canal, creating the Joint Companies, with a monopoly on New York-Philadelphia traffic.

In 1832, the New Jersey Railroad Company was incorporated, establishing an initial route between New Brunswick and Jersey City. The line ran through Newark and had ferry connections between Jersey City and Manhattan. The New Jersey Railroad Company leased the right to bridge the Hackensack and Passaic rivers from the bridge proprietors; the railroad used the existing bridge until a new bridge was constructed adjacent to the old in 1846. The railroad constructed a cut through Bergen Hill in Jersey City and crossed the Meadowlands to Newark (passing through the APE in Kearny). The New Jersey Railroad was primarily a passenger line, and earned a reputation for comfort and convenience (Lane 1939: 363). The Morris & Essex Railroad was chartered in 1835 connecting Morristown and Newark. In 1836, the New Jersey Railroad agreed to carry Morris & Essex traffic between Newark and Jersey City. In 1868, the Delaware, Lackawanna, and Western Railroad leased the Morris & Essex Railroad, including all of its branches. With the establishment of the rail lines, stage coach companies between New York and Philadelphia ceased to operate (Lane 1939: 381).

The New York and Erie Railroad was constructed during the 1830s; it skirted the northern edge of New Jersey from Piermont on the Hudson River in New York. The Erie was expanded and unified with the existing Paterson and Hudson River Railroad, so that in 1851, the railroad connected Jersey City and Lake Erie. (Lane 1939: 317).

The New Jersey Railroad Company and the Camden and Amboy Railroad (Joint Companies) were consolidated as the United Canal and Railroad Companies of New Jersey in 1867. In 1871, the Pennsylvania Railroad leased the consolidated company for 999 years, and thus acquired a continuous route from New York to Philadelphia (with a ferry connection across the Hudson) (Stinson 1915: 370).

The popularity of toll roads was revived in New Jersey beginning in the 1850s, due to the advancement of technology for sawing lumber, which enabled plank roads to be constructed at a reasonable cost. These roads, consisting of sawn wood planks created a smoother surface than macadam, and were more economical. By 1857, New Jersey had authorized 23 plank road corporations. Rather than competing with canals and railroads, plank roads tended to improve local transportation in areas not accessible by other modes. The Newark Plank Road and Ferry Company, established in 1849, was first and the most successful of northern New Jersey routes. The New Jersey Railroad Company, which maintained the monopoly over bridges, acquired over fifty percent interest in the Newark Plank Road and permitted a new bridge to be constructed over the Hackensack River (just south of the APE).

Until the turn of the century, railroads transporting goods and passengers between New Jersey and Manhattan relied on ferries to make the connection across the Hudson River. The first tunnel across

the Hudson River was accomplished as part of the Hudson & Manhattan Railroad. Planning for this railroad began in the 1860s when DeWitt Haskins formed the Hudson Tunnel Railroad Company, but work was interrupted in the 1870s due to financial and political difficulties. The project was resumed in 1889 under the leadership of William McAdoo, who established the Hudson & Manhattan Railroad Company. The tunnel beneath the Hudson River was built between 1902 and 1908. The railroad ran across the Meadowlands (within the APE) between Newark and Jersey City. The Hudson & Manhattan Railroad was a passenger line, and gained a reputation for comfort and convenience, and inspired suburban development in the New Jersey towns surrounding it.

Over the 1890s and early 1900s, the Pennsylvania Railroad elevated its tracks, creating a grade-separated right-of-way. Between 1902 and 1910, the Pennsylvania Railroad constructed a new branch through the Hackensack Meadows, passing through Bergen Hill, and tunneling beneath the Hudson River and across Manhattan, with tubes beneath the East River connecting to the Long Island Railroad. The Pennsylvania Railroad was electric from the Hudson River tubes to the Manhattan Transfer Station in Harrison, using a third rail DC system; the remainder of the line was electrified in 1933, replacing the DC system with 12,000 volt, 25 Hz AC system. The third rail was removed from the west portal of the Bergen tunnels to the Manhattan Transfer Station (ARC DEIS 2005:60). Passengers could also transfer between the Pennsylvania Railroad and the Hudson & Manhattan Railroad at the Manhattan Transfer.

The Hackensack Meadows branch of the Pennsylvania is now part of Amtrak's Northeast Corridor and runs through the APE in Secaucus and Kearny. The original Hudson & Manhattan system is now operated by the Port Authority of New York and New Jersey as the "PATH," which continues to be a vital commuter rail line.

Between 1922 and 1932, Route 1 Extension was constructed south of the APE to provide express service between the Holland Tunnel and Newark Airport. This freeway included the Pulaski Skyway, a series of cantilever truss bridges crossing the Hackensack and Passaic rivers.

Also in the 1930s, discussions began in support of constructing a major highway from Boston to Washington. Momentum dissipated with the advent of the Great Depression; however, New Jersey Governor Alfred E. Driscoll reintroduced the idea in the mid-1940s. In 1948, the State Legislature enacted the New Jersey Turnpike Authority Act, which created the New Jersey Turnpike Authority to oversee the planning, construction, and maintenance of the highway. The planning and construction of the roadway were put on an accelerated timeline. Multiple engineering firms were hired to design a roadway that combined speed and efficiency with progressive safety features. Construction of the Turnpike began in 1950 and was completed by 1952. A 5,623-foot-long bridge was constructed over the Hackensack River between Secaucus and Kearny. The approach to the bridge passed below the Pulaski Skyway in Kearny, and charted its course through the marshes using a combination of crushed stone embankments and caissons filled with sand.

B. PREVIOUSLY CONDUCTED CULTURAL RESOURCE SURVEYS

Information concerning known and potential archaeological resources in the archaeological APE was developed through a review of previously conducted cultural resource investigations performed in the project area vicinity, listings of previously identified archaeological sites on file at the NJHPO, and a review of relevant sensitivity assessments.

A search of archaeological reports and research materials on file at the NJHPO indicate that several cultural resources investigations have been conducted within one half-mile of the project

area. The results of these investigations are summarized in **Table 5.2-1** below and a more detailed description of studies related to the Historic Cemeteries of Hudson County and the Northeast Corridor study follows.

Table 5.2-1
Previously Conducted Cultural Resource Investigations Within One Mile of the Project Area

Project Name	Location	Findings	Reference
NJ Turnpike Exit 11 to US Route 46	Within/ adjacent to APE in Secaucus	Sensitivity assessment; no archaeological resources identified, mentions reports of sites at Snake Hill, but no confirmation of their existence	LBA, 1989
NJ Turnpike Exit 11 to US Route 46	South of APE	Passaic River Bridge and Pulaski Skyway evaluated	LBA, 1986
Secaucus Transfer Station	Within/ adjacent to APE in Secaucus	Sensitivity assessment; no archaeological resources identified, mentions reports of sites at Snake Hill, but no confirmation of their existence	HCI, 1990
NJ Turnpike- Secaucus and Jersey City	Within/ adjacent to APE in Secaucus	Phase 1B; no further work recommended	Greenhouse, 1995
NJ Turnpike- Secaucus and Jersey City	Overlapping with APE in Secaucus	Phase 1B investigation; located elements of Historic Cemeteries of Hudson County ; Phase II recommended	Greenhouse, 1996a
Secaucus Interchange Project (NJ Turnpike Interchange 15X)	South of APE	Phase II investigation of St. Peter's Cemetery, outside of APE	Greenhouse, 1996b
Sensitivity Assessment	Meadowlands	Phase 1A Assessment of archaeological sensitivity for the Meadowlands region	J. Grossman, 1992
Seaview Drive Extension	Adjacent to APE, Secaucus	Archaeological testing at intersection of Seaview Drive and County Road; no significant archaeological resources present	RBA, 2003
Sewer-Secaucus	Secaucus Loop area	Sensitivity assessment; no further work recommended	Sloshberg, n.d.
Northeast Corridor Survey- New Jersey	Within/ adjacent to APE in Secaucus	Sensitivity assessment; identified Snake Hill and Penhorn Creek as potentially sensitive for prehistoric cultural resources	DeLeuw Cather Parsons, 1979
NJ Turnpike Secaucus Interchange	Within/ adjacent to APE in Secaucus	Sensitivity assessment, identified presence of Historic Cemeteries of Hudson County in Secaucus Interchange area	Geismar, 1992
Allied Junction Site- Secaucus	ARC in Secaucus Transfer Station area	Sensitivity Assessment; no further work recommended	HCI, 1989
Meadowlands- Bergen/Hudson Counties		Unknown	Research Arch. Mgmt. n.d.
Hudson County Sewage	Within/ adjacent to APE in Secaucus	Reports prehistoric archaeological sensitivity of Snake Hill; no other documented archaeological resources	HCI, 1978
Routes 1 & 9- Jersey City and North Bergen	South of Route 3, Northeast Corridor tracks	No proposed plans for archaeological testing	Hunter Research, 1987

Table 5.2-1 (cont'd)
Previously Conducted Cultural Resource Investigations
Within One Mile of the Project Area

Project Name	Location	Findings	Reference
Hudson County Sewerage	South APE in Secaucus, on Penhorn Creek	Phase 1B archaeological testing along Penhorn Creek, no significant archaeological resources encountered	HCI, 1978
Routes 1 & 9- Jersey City	Tonnelle Avenue; south of APE	Phase I/II archaeological survey and palynological analysis; no cultural resources present	RBA Group, 2000
Hackensack River Tidal Barrier	South of the APE in Secaucus	Phase I archaeological survey and palynological analysis; no cultural resources present	Kardas & Larabee, 1982
Access to the Region's Core	Within/ adjacent to APE in Secaucus and Kearny	Phase 1A archaeological survey identified the Secaucus Potter's Field (Historic Cemeteries of Hudson County) area as being sensitive for historic-period archaeological remains. No other areas in or near the Portal Bridge APE were identified.	Transit Link Consultants, 2005
Potter's Field Disinterment/ Reinterment: Secaucus Interchange Project (NJ Turnpike Interchange 15X)	Within/ adjacent to APE in Secaucus	Data recovery technical report for excavation in Potter's Field area. Remains of 4,571 individuals exhumed from a 4.1-acre area.	Louis Berger Group, Inc., 2005

Northeast Corridor Survey

An archaeological sensitivity assessment for the Northeast Corridor (DeLeuw Cather Parsons, 1979), which runs through the present APE, identified two 'Prehistoric Archaeological Zones' in or near the present APE. The first is recorded in the files of the NJHPO as *Hudson County, Secaucus Town: Site No. 2*, and is located within and adjacent to the archaeological APE in Secaucus, encompassing Snake Hill and the area east of Snake Hill; the second is recorded as *Hudson County, Secaucus Town: Site No. 4*, was identified along Penhorn Creek, near the intersection of Secaucus Road in Secaucus, northeast of the APE. The first of these areas was clearly identified as sensitive based on its high elevation, which would have been attractive as a settlement location during prehistory, affording easy access to the faunal and floral resources of the Meadowlands. More recent surveys of this area conducted as part of the Secaucus Interchange Project and the ARC DEIS have resulted in a lowering of the prehistoric sensitivity of Snake Hill to low based on the effect of historic and modern disturbance to the area. The basis for the identification of the second zone as sensitive is not known.

Previous Surveys of the Historic Cemeteries of Hudson County

As noted previously, the Hudson County Burial Grounds at Snake Hill were active by 1880, and ceased operation in 1962. The burial grounds were impacted by the construction of the New Jersey Turnpike in the early 1950s, while the burial grounds were still active, when several bridge piers and abutments forced the Turnpike Authority to relocate multiple graves to a nearby location. In the 1980s, Hudson County constructed a temporary detention center over a portion of the burial

grounds. At this time, Hudson County was not aware of the location and extent of the burial grounds.

In 1992, the Turnpike Authority began planning on the Secaucus Interchange Project, and hired Joan Geismar, PhD to conduct a Phase 1A archaeological survey of the burial grounds area. Geismar was unable to find accurate maps and burial records detailing the number of burials or the boundaries of the burial grounds, however, she recommended that a Phase 1B archaeological investigation be conducted to ascertain whether human remains were still interred at the site.

Greenhouse Consultants conducted a Phase 1B study in 1996. The study used ground penetrating radar (GPR) and a limited number of backhoe trenches and shovel test pits to determine that human remains and coffin fragments were present on the site between 1.4 and 4.85 feet below ground surface. Despite these findings, the NJHPO determined that the site did not meet the eligibility criteria for listing in the S/NR because it lacked depositional integrity, and the Secaucus Interchange Project received a finding of no adverse effect.

In April 2002, a Register of Burials, including maps and records relating to portions of the Historic Cemeteries of Hudson County , was uncovered by Hudson County. These documents indicated that roughly 1,200 burials occurred within the 'Potter's Field' (one of the three cemeteries comprising the burial grounds) between 1920 and 1962. The Turnpike Authority reopened discussions with the NJHPO, however despite the additional information regarding the location and extent of burials, the NJHPO maintained their determination that the burial grounds were not eligible for the S/NR.

In October 2002, the Turnpike Authority hired the Louis Berger Group to undertake the disinterment and reinterment of burials that could be impacted by actions related to the Secaucus Interchange Project. The Secaucus Interchange Project was expected to impact a roughly 4-acre area bounded roughly by New County Road on the north, the Main/Bergen County and Pascack Valley Lines on the east, and the New Jersey Turnpike on the south (the APE extended south of the Turnpike in one location) (see Figure 5.2-2). Berger's field excavations occurred between February and October 2003 and involved a team of over 100 archaeologists and field technicians. The team exhumed the remains of 4,571 individuals from a roughly 2.3-acre area identified as the 'Potter's Field.' A total of 113,579 non-skeletal artifacts were recovered, including coffin nails and grave goods of various sorts. Osteological analyses revealed information on causes of death, and the identities of 825 individuals were determined based on archival and physical evidence. Direct descendents of two individuals were identified, and these were returned to their families for private reburial. In the fall of 2004, the remaining 4,569 individuals were reinterred with their personal effects in Maple Grove Park Cemetery in Hackensack, Bergen County, New Jersey, and a plaque was erected listing over 7,000 names listed in the burial ledgers (LBG 2005). Following the 2005 publication of Berger's *Potter's Field: Disinterment/Reinterment* report, the NJHPO rescinded their earlier determination and considered the burial grounds eligible for listing in the S/NR (TLC 2005: 109).

In 2005, Transit Link Consultants completed a Phase 1A archaeological study on behalf of New Jersey Transit in association with the ARC project, which proposed improvements to the Northeast Corridor Line in New York and New Jersey. The ARC APE included portions of the Historic Cemeteries of Hudson County area of sensitivity, and overlapped with portions of the Secaucus Interchange Project APE. The Phase 1A recommended that GPR and hand excavation be conducted to determine whether human remains were present within the ARC APE.

A Geophysical Investigation Report was completed in February 2007. Two search areas ('Rocky Hill,' comprising 720 linear feet from the south side of Snake Hill to the west end of a water-filled retention basin; and 'Retention Basin,' comprising 840 linear feet of the retention basin) were tested using non-intrusive GPR. These areas, located from just north of the New Jersey Turnpike to just north of the Northeast Corridor, are largely inundated by stormwater run-off, and GPR was conducted in winter while the area was covered with ice. The study detected four anomalies (one within the 'Rocky Hill' search area, and three within the 'Retention Basin' search area) that could potentially represent burial shafts (GGI 2007: 2).

Due to refined alignments developed subsequent to the completion of the Geophysical Investigation Report, the ARC project is no longer expected to impact the areas identified by the ARC DEIS as sensitive for remains relating to the Historic Cemeteries of Hudson County. Although, no further archaeological testing in those areas is planned in association with the ARC project, testing will be conducted south of the Northeast Corridor in the area of the Malanka Landfill (Mary Ann Mason, pers. comm., June 7, 2007).

P.O. Box 404
Trenton, NJ 08625-0404

Re: **Portal Bridge Capacity Enhancement Project – Draft Environmental Impact Statement**
Hudson County, New Jersey

Dear Ms. Guzzo:

The National Railroad Passenger Corporation (Amtrak) and the New Jersey Transit Corporation (NJ TRANSIT) are proposing capacity enhancements to the Portal Bridge crossing of the Northeast Corridor rail line over the Hackensack River. Portal Bridge is listed on the New Jersey State Register (SR).

The project sponsors are seeking approvals from the Federal Railroad Administration (FRA), and as such, a Draft Environmental Impact Statement (DEIS) will be prepared in accordance with the National Environmental Policy Act (NEPA) (as amended) and the Council on Environmental Quality's (CEQ) implementing regulations under NEPA. Additionally, the project will be subject to the New Jersey Register of Historic Places Act; Section 4(f) of the United States Department of Transportation (DOT) Act; Section 106 of the National Historic Preservation Act of 1966, as amended and associated implementing regulations in 36 CFR 800. Per Subpart A, Section 800.2(a)(3) and 800.2(c)(4) of 36 CFR, FRA is authorizing the project sponsors, as an applicant for federal approvals, to prepare information, analyses, and recommendations regarding Section 106 consultation for the referenced project.

The purpose of this letter and the attached "Cultural Resources Methodology," (prepared on behalf of Amtrak and NJ TRANSIT), is to afford your office the opportunity to review: 1) the proposed methodologies for the study of archaeological and architectural resources; 2) the proposed definition of the Area of Potential Effect (APE); and 3) proposed impacts assessment criteria for the project. Please note that the project scope and alternatives are still being developed, and, as the project plans evolve, refinements will be made to the project alternatives described in the attached methodology. We do not expect the proposed methodologies and impacts assessment criteria to change significantly; however, specific project elements may be altered that could require changes to the APE. As mandated by the regulations governing such work, the archaeological and architectural resources analyses will be prepared in consultation with the State Historic Preservation Office (SHPO).

NJ TRANSIT is looking forward to discussing the project and the proposed methodologies with you. Please do not hesitate to contact Mr. David Valenstein of this office if you have any questions or need further clarification about the proposed project. He may be reached at (202) 493-6368, or by email at david.valenstein@dot.gov.

Sincerely,

Mark E. Yachmetz

PORTAL BRIDGE

CAPACITY ENHANCEMENT

Attachment A:
Cultural Resources Methodology

DRAFT

Prepared on behalf of:

Amtrak and NJ TRANSIT

Prepared by:

AKRF, Inc.
440 Park Avenue South
New York, NY 10016

February 2007

Attachment A: Cultural Resources Methodology

PROJECT DESCRIPTION

Amtrak and NJ TRANSIT are proposing the Portal Bridge Capacity Enhancement Project to address problems posed by the existing river crossing. The project will include examination of alternatives including replacement, rehabilitation, or modification of the existing Portal Bridge. To address the bottleneck between Swift Interlocking and Secaucus Junction, several of the project alternatives will include construction of additional track(s) between these two points. Other alternatives may include additional track(s) only along the eastbound and westbound bridge approaches. The project's geographic limits are presently bound by the New Jersey Turnpike (I-95) to the west and Secaucus Junction to the east. The northern and southern project limits will be refined as the project alternatives are developed; however, they may extend beyond the existing rail right-of-way. For purposes of the EIS, the project build year will be approximately 2012 to 2013. The year of analysis will be 2025.

Consistent with NEPA requirements, the project alternatives to be evaluated will include a No Action Alternative, wherein the existing structure would remain in place and only regular maintenance would occur, and several build alternatives.

NO ACTION ALTERNATIVE

The No Action Alternative consists of the transportation facilities most likely to be in place by the design year of 2025. The No Action Alternative assumes that the existing Portal Bridge will remain in place and will be subject only to regular maintenance, and serves as a baseline for comparison to the build alternatives. The No Action Alternative also takes into account planned improvements that have recently been completed or are programmed for completion in the near future, as well as planned improvements that are included in the long-range regional transportation plan. A major project to be included in the No Action Alternative is NJ TRANSIT's "Access to the Region's Core" – the proposed construction of a new passenger rail tunnel underneath the Hudson River, along with multiple, other rail improvements. Small-scale projects may include "state-of-good-repair" maintenance as well as improvements to switches, signals, tracks and platforms. These additions achieve some incremental capacity for the rail system, reduce dwell times, and add to system redundancy. Major investment projects involve substantial improvements to the transportation system in the region. A complete list of applicable projects to be included in the No Action Alternative will be included in the EIS.

BUILD ALTERNATIVES

The EIS will consider a number of different build alternatives to improve the existing Northeast Corridor rail crossing over the Hackensack River. These alternatives will consider retention, modification, and removal of the existing Portal Bridge, and construction of one or more new bridges. For the new bridge(s), alternatives proposed will vary in bridge height, operation type (moveable/fixed), and number of tracks.

Alternatives Retaining the Existing Portal Bridge

These alternatives would retain the existing Portal Bridge and include construction of a new two or three track bridge, either fixed or moveable.

Alternatives Modifying the Existing Portal Bridge

These alternatives would involve physically modifying the existing Portal Bridge (beyond normal maintenance), rehabilitating the structure, and raising it above its existing height. Some of these alternatives would raise the existing bridge to allow fixing it in the closed position. Other alternatives would raise the bridge to a lesser height and retain its moveable nature. These alternatives would also include a new bridge, either fixed or moveable, with two or three tracks.

Alternatives Removing the Existing Portal Bridge

These alternatives would involve the construction of two new bridges and removal of the existing Portal Bridge. These alternatives would include a mix of bridge height, operation type (moveable or fixed), and alignment along the Hackensack River. Some of these alternatives would include the construction of a new two- or three-track moveable bridge with a second new two-track fixed or moveable bridge. Other alternatives in this category would include a new two- or three-track fixed bridge and a second new two-track fixed bridge.

PROPOSED ARCHAEOLOGICAL AND ARCHITECTURAL RESOURCES METHODOLOGIES

Since the project is still in a conceptual development and alternatives analysis stage, the location of specific project components has not yet been finalized. The analysis of archaeological and architectural resources will focus on the project site and appropriate APEs for each type of resource. Proposed methodologies for the study of archaeological and architectural resources are described below.

ARCHAEOLOGICAL RESOURCES

To evaluate archaeological resources, a Phase 1A Archaeological Survey Report will be prepared for the archaeological resources APE to determine whether areas that would be impacted by the proposed project may contain archaeological resources. The Phase 1A report will be prepared with the following steps:

1) Identify the APE for the project in consultation with NJHPO.

2) Review prehistoric sensitivity maps/models to establish areas potentially sensitive for prehistoric resources that could be disturbed by the proposed project. Materials for review include the files of the New Jersey State Museum and the NJHPO.

3) Review historic maps to establish potential historic-period archaeological resources that could be disturbed by the proposed project. Cartographic research will be conducted at such repositories as the New York Public Library, the New Jersey Historical Society, the New Jersey Meadowlands Commission and other local libraries and historical societies.

4) Identify any potential archaeological resources. To meet New Jersey State standards for the preparation of Phase 1A Archaeological Survey Reports, in-depth research in potentially sensitive areas may be required, including tax lots, occupation and ownership records, and census, directory, and tax data. Evidence of prior disturbance will also be gathered.

5) Evaluate the possible significance of any potential archaeological resources that may be present in the APE in consultation with NJHPO using the National Register of Historic Places criteria for significance. The types of potential resources that may be present will be compared to other such recorded resources, if applicable, and their potential to yield information and/or address important research issues will be assessed.

6) Establish which types of resources may require further study in consultation with NJHPO.

7) Evaluate potential project impacts on any identified resources.

8) Establish appropriate mitigation measures or additional study (e.g., Phase 1B archaeological testing and/or data recovery) for any potential resources that would be disturbed as a result of the proposed project in consultation with NJHPO.

ARCHITECTURAL RESOURCES

The following steps for the study of architectural resources will be undertaken:

1) Identify the APE for the project in consultation with NJHPO. This is the area where proposed construction activities may be close enough to an historic structure to potentially cause structural damage and where visual or contextual impacts may occur.

2) Identify any officially recognized architectural resources within the APE. These include properties listed on the State and National Registers of Historic Places (S/NR), properties determined eligible for such listing, National Historic Landmarks (NHL), and locally designated landmarks.

3) Conduct a survey of the APE to identify any properties that appear to meet eligibility criteria for listing on the S/NR, based on the Code of Federal Regulations, Title 36, Part 60.

4) Research all potential architectural resources to identify pertinent historical information, such as date of construction, builder, and architect.

5) Prepare survey forms for any previously undesignated resources in the APE in accordance with the NJHPO's *Guidelines for Architectural Survey*; and submit the forms to NJHPO for determinations of eligibility.

6) Assess any effects on historic properties in consultation with NJHPO. These may include physical impacts, such as damage from construction related activities, or visual or contextual impacts.

7) Evaluate any required mitigation measures in consultation with NJHPO.

DEFINITION OF THE AREAs OF POTENTIAL EFFECT (APEs)

The APEs described below and shown on Figure A-1 may be refined based on site visits and may be enlarged depending on the set of access route alternatives selected.

APE FOR ARCHAEOLOGICAL RESOURCES

The area of potential effect for archaeological resources includes all areas that could experience ground disturbance under the proposed project alternatives.

The archaeological APE is bounded by the intersection of the Northeast Corridor Line railroad right-of-way (ROW) and the New Jersey Turnpike (I-95) on the west; and by Secaucus Junction train station on the east. The APE extends 100 feet north and south of the railroad ROW between the western boundary and the intersection of the Belleville Turnpike; and 300 feet north and south of the railroad ROW between the Belleville Turnpike and the eastern boundary.

APE FOR ARCHITECTURAL RESOURCES

In general, potential effects to architectural resources can include both direct physical effects (e.g., demolition, alteration, or damage from construction on nearby sites) and indirect, contextual effects, such as the isolation of a property from its surrounding environment, or the introduction of visual, audible, or atmospheric elements that are out of character with a property or that alter its setting. The APE for architectural resources is, therefore, larger to account for any potential impacts that may occur where proposed construction activities could physically alter architectural resources or be close enough to them to potentially cause physical damage or visual or contextual impacts.

The APE for architectural resources for this project will be defined as the area surrounding the project site within visual range and to account for potential construction-related impacts.

The APE for architectural resources is bounded on the west by a point 400 feet west of the intersection of the Northeast Corridor Line railroad ROW and I-95; and on the east by a point 400 feet east of the Secaucus railroad station. The northern boundary of the architectural APE runs along the northern edge of the eastern spur of I-95 between the western boundary and the intersection of the Former Boonton Line and I-95; between this intersection and the eastern boundary, the APE extends 700 feet north of the railroad ROW. The southern boundary of the APE extends 500 feet south of the railroad ROW between the western boundary and the intersection of the Newark Turnpike; the APE runs along the outer edge of the Newark Turnpike between that point and the intersection of State Route 7; between State Route 7 and the Former Boonton Line, the APE extends 1500 feet south of the railroad ROW; between the Former Boonton Line and the eastern boundary, the APE extends 700 feet south of the railroad ROW.

PROPOSED IMPACTS ASSESSMENT CRITERIA

Once the archaeological and architectural resources in the APEs are identified, the effects of the project on those resources are assessed. The impacts analysis will be based on the proposed construction and the anticipated effects it may have on archaeological and architectural resources.

ARCHAEOLOGICAL RESOURCES

Potential in-ground disturbances of the project site may result from improvements to the existing Portal Bridge and/or construction of a new bridge or bridges over the Hackensack River in the project area. Modifications and/or additions to existing railroad tracks and other railroad infrastructure could occur throughout the archaeological APE.

ARCHITECTURAL RESOURCES

Architectural resources may be impacted by elements of the proposed project alternatives including modifications to the existing SR-Listed Portal Bridge and/or construction of a new bridge or bridges over the Hackensack River; and modifications and/or additions to existing railroad tracks and other railroad infrastructure throughout the project site.

Re: **Portal Bridge Capacity Enhancement Project- DEIS**
Hudson County, New Jersey
Consulting Parties and Proposed Outreach Methodology

Dear Ms. Guzzo:

As you know, the National Railroad Passenger Corporation (Amtrak) and the New Jersey Transit Corporation (NJ TRANSIT) are proposing capacity enhancements to the Portal Bridge crossing of the Northeast Corridor rail line over the Hackensack River. The Federal Railroad Administration (FRA) wrote to your office on February 27, 2007 on behalf of Amtrak and NJ TRANSIT to afford your office the opportunity to review: 1) the proposed methodologies for the study of archaeological and architectural resources; 2) the proposed delineation of the Area of Potential Effect; and 3) proposed impacts assessment criteria for the proposed project.

This letter seeks your concurrence with the identification of proposed consulting parties and outreach methodologies proposed for the Portal Bridge Capacity Enhancement Project. In accordance with the guidelines of Section 106 of the National Historic Preservation Act of 1966, potential cultural resource stakeholders have been identified, and an outreach program has been developed in order to allow consistent contact with these stakeholders regarding project development and potential historic and archaeological resources.

In addition to the New Jersey Historic Preservation Office, the project has identified 37 potential consulting parties for the proposed Portal Bridge Capacity Enhancement Project (see Attachment). Interested parties were selected based in part on stakeholders identified as part of the Section 106 compliance process for NJ TRANSIT's Access to the Regions Core Project (*ARC:DEIS*, 2006). We are seeking your confirmation that the consulting parties listed below are appropriate for the proposed project.

As part of our outreach program, a letter will be sent to each of the proposed consulting parties describing the proposed project and inviting their comments on: the proposed methodologies for the cultural resources studies; the proposed Area of Potential Effect for the project; and the proposed impacts assessment criteria for the proposed project. Each of the potential consulting parties will also be invited to attend a Section 106 Consulting Parties meeting to be held at NJ TRANSIT's offices in May 2007.

Please do not hesitate to contact me at (202) 493-6368, or by email at david.valenstein@dot.gov if you have any questions or need further clarification

Sincerely,

David Valenstein

Re: **Portal Bridge Capacity Enhancement Project- DEIS**
Hudson County, New Jersey
Archaeological Area of Potential Effect Modification

Dear Ms. Guzzo:

As you know, the National Railroad Passenger Corporation (Amtrak) and the New Jersey Transit Corporation (NJ TRANSIT) are proposing capacity enhancements to the Northeast Corridor's Portal Bridge crossing of the Hackensack River. The Federal Railroad Administration wrote to your office on February 27, 2007 to afford your office the opportunity to review: 1) the proposed methodologies for the study of archaeological and architectural resources; 2) the proposed delineation of the Area of Potential Effect (APE); and 3) proposed impacts assessment criteria for the proposed project.

We are now writing to inform you of a modification of the project's archaeological and architectural APEs. The archaeological APE has been expanded to include the Standard Chlorine Chemical Company property located between the Hackensack River and the Belleville Turnpike, south of the Northeast Corridor Line tracks in Kearny. The archaeological and architectural APEs have also been extended to include a portion of the Northeast Corridor tracks to the west of the New Jersey Turnpike (see attached Figure 1).

Please do not hesitate to contact Mr. David Valenstein of this office if you have any questions or need further clarification. He may be reached at (202) 493-6368, or by email at david.valenstein@dot.gov

Commissioner

June 29, 2007

Mr. Mark Yachmetz
Associate Administrator
for Railroad Development
Federal Railroad Administration
1120 Vermont Ave. NW
Washington D.C., 20590

Dear Mr. Yachmetz:

As Deputy State Historic Preservation Officer for New Jersey, in accordance with 36 CFR Part 800: Protection of Historic Properties, as published in the Federal Register on 6 July 2004 (69 FR 40544-40555), I am providing **Initial Consultation Comments** for the following proposed undertaking:

Secaucus Town, Hudson County
Portal Bridge Capacity Enhancement Project
Federal Transit Administration, NJ Transit.

This letter is in response to your submission of documents initiating consultation pursuant to the requirements of 36 CFR Parts 800.3 and 800.4. The project will include an examination of alternatives including replacement, rehabilitation or modification of the existing Portal Bridge. To address the bottleneck between Swift Interlocking and Secaucus Junction, several of the project alternatives will include construction of additional track(s) between those two points, while others may include additional track(s) only along the eastbound and westbound bridge approaches.

800.3 Initiation of the Section 106 Process

With the addition of NJ Transit, I concur that the Historic Preservation Office (HPO), the Town of Secaucus, the New Jersey Meadowlands Commission, and the Federal Transit Administration (FTA) are the appropriate public agency consulting parties for the initiation of consultation. Public involvement activities may identify additional public agency or private organization consulting parties.

As is noted in the submitted documentation, the public outreach program for the proposed project will consist of soliciting comments on the historic resources from all consulting and interested parties as well as the intention to prepare a project presentation for interested and consulting parties. I would recommend consulting with the same parties in the event of an Adverse Effect determination, and requesting comments on a draft Memorandum of Agreement (MOA), if required. Overall, the HPO approves of the plan for public involvement.

800.4 Identification of Historic Properties

Generally, I agree with the architectural Area of Potential Effect (APE) for the project as defined in the revised APE delineation dated June 4, 2007. However, before I can concur formally, I request that the description for the architectural APE be re-written to better explain how the boundaries relate to above-ground resources and the proposed constructive activity. For example, why is the northern boundary approximately 500-600 feet from the railroad ROW before it crosses Belleville Turnpike, but follows Route I-95 after it crosses the Belleville Turnpike, even though the extent of constructive activity appears the same?

The HPO also has reviewed the documentation submitted that defines the archaeological APE for the above-referenced project. The HPO concurs with the archaeological APE as defined in the revised APE delineation submitted in a letter from you dated June 4, 2007, provided that any future project changes result in appropriate changes in the archaeological (and architectural) APE. The HPO also concurs with the Phase IA methodology outlined in your previous correspondence dated February 27, 2007.

I also agree that the list of interested parties, 33 in all, are entities with a potential interest in and a knowledge of historic properties within the APE and should be considered information resources for the pending cultural resources evaluation. Please note that in the course of conducting background research for the Phase IA survey, it may be appropriate to consult with Dr. Joel Grossman, a local expert in the paleoenvironment and archaeology of the New Jersey Meadowlands. He may be reached at jwgnyny@optonline.net.

Lastly, I would like to point out that the Hudson County Division of Cultural & Heritage Affairs/Tourism Development (with Bill Larosa and Stephen Masks as contacts) is located in Jersey City, Hudson County, not Newark City, Essex County.

Additional Comments

This office looks forward to receiving the revised architectural APE description for review and approval. If you have any questions regarding these comments, please contact Marianne Walsh at 609-984-0850 or marianne.walsh@dep.state.nj.us.

Sincerely,

Dorothy P. Guzzo

Re: **Portal Bridge Capacity Enhancement Project – Draft Environmental Impact Statement**
Hudson County, New Jersey

Dear Ms. Guzzo:

Thank you for your comment letter of June 29, 2007, in response to our initiation of Section 106 consultation for the Portal Bridge Capacity Enhancement Project in conjunction with preparation of a Draft Environmental Impact Statement (DEIS). The project is proposed by the National Railroad Passenger Corporation (Amtrak) and the New Jersey Transit Corporation (NJ TRANSIT) to improve the Hackensack River crossing over the New Jersey State Register (SR) listed Portal Bridge on the Northeast Corridor.

Your comment letter expresses concurrence with the consulting parties and interested parties that we have identified. Furthermore, as per your suggestion, we have reached out to Dr. Joel Grossman, a local expert in the paleoenvironment and archaeology of the New Jersey Meadowlands in order to make him aware of the proposed project and solicit his input.

Your comment letter concurs with the architectural and archaeological Area of Potential Effect (APE)'s delineated for the project, though you request more specific explanations of the rationale for the architectural APE boundaries. Below is a revised APE description. The APE boundaries remain the same, however, more detail has been added justifying the shape of the boundary.

I have also enclosed for your review two New Jersey Historic Structure Inventory forms that have been completed in association with this project. One form documents the former Edison Battery Company Property and the other form documents the former White Tar Products Company Property. Both the properties are currently part of the Standard Chlorine Chemical Company Property in Kearney, and are located in the Architectural Area of Potential Effect (APE) delineated for this project. We request your concurrence with our determination that the former Edison Battery Company Property is State/National Register-eligible, and that the former White Tar Products Company Property is not eligible.

APE FOR ARCHITECTURAL RESOURCES

In general, potential effects to architectural resources can include both direct physical effects (e.g., demolition, alteration, or damage from construction on nearby sites) and indirect, contextual effects, such as the isolation of a property from its surrounding environment or the introduction of visual, audible, or atmospheric elements that are out of character with a property or that alter its setting. The APE for architectural resources (shown in Figure 1) is, therefore, larger to account for any potential impacts that may occur where proposed construction activities could physically alter architectural resources or be close enough to them to potentially cause physical damage or visual or contextual impacts.

The APE for architectural resources for this project is defined as the area surrounding the project site within visual range and accounts for potential construction-related impacts.

The APE for architectural resources is bounded on the west by a line 2,100 feet west of the intersection of the Northeast Corridor and I-95; and on the east by a line 400 feet east of the Secaucus Transfer Station. These boundaries have been delineated to account for potential visual impacts of proposed construction activity along the Northeast Corridor, including the eastern and western limits of such construction activity. The northern and southern boundaries of the architectural APE extend between 500 and 1,500 feet from the Right-of-Way (ROW). The northern boundary has been limited to 500 on the eastern and western ends of the APE because construction in these areas is expected to be relatively limited and because visibility to and from the project site in these areas would be substantially blocked by the 161-acre "1-D Landfill" in Kearny and by Snake Hill in Secaucus. The northern boundary extends farther between the intersection of the Northeast Corridor with the New Jersey Turnpike and the Boonton Line to account for wider visibility along the Hackensack River and the surrounding marshlands. In this area, the northern APE is bounded by the New Jersey Turnpike's eastern spur, which substantially blocks views between the project site and areas further north. The southern boundary has also been drawn to account for views to and from the project site, extending farther in areas of undeveloped and low-lying land where large buildings, roadways, and railroads do not already substantially block views.

Should you have any concerns please do not hesitate to contact Mr. John Wilkins of NJ TRANSIT at (973) 491-7797, or Mr. David Valenstein of this office at (202) 493-6368.

Sincerely,

Mark E. Yachmetz

Edison Battery Property (Standard Chlorine Chemical Company): Base Form

Description:

General Historical Background

Following the development of the first railroads through the area in the 1860s and 1870s, eastern Kearny was transformed from undeveloped marshlands to a center of industry. The Mile End Thread Mills, Marshall Linen Thread Mills, and the Nairn Manufacturing Company, a linoleum factory, were among the large industries established in Kearny between the mid-1870s and the mid-1880s (Stinson 1915: 371).

The portion of eastern Kearny located south of the Pennsylvania Railroad (Northeast Corridor), along the west side of the Hackensack River became the site of multiple industrial facilities. The parcel located immediately south of the Northeast Corridor Line, now known as the Diamond Shamrock property, was first developed in 1916 by the Martin-Dennis Company, which produced sodium bichromate and potassium dichromate, chemicals used in the preparation of Tanolin, a leather tanning agent. A 1936 Sanborn map shows over a dozen buildings on the Martin-Dennis property (Sanborn 1936). In 1916, the White Tar Company purchased a long narrow parcel directly south of the Diamond Shamrock property, and constructed several buildings on the site for the refinement of crude naphthalene for the production of moth repellents, disinfectants, and deodorizers.

The Thomas A. Edison Company purchased the land directly south of the White Tar Company property in 1917 (*NYT* 1917). The property was bounded on the west and east by the Belleville Turnpike and the Hackensack River, respectively. Buildings were not constructed on this site until the mid 1920s, when the company (Thomas A. Edison Company's subsidiary, the Emark Battery Corporation) began production of batteries there.

The Koppers Gas & Coke Company purchased the White Tar Company property (north of the Edison property) in 1942, and continued production of naphthalene products (ATSDR 2005: 3). Later, the Koppers Company purchased the Edison site and merged it with the parcel to the north to create the Tar Products Division-Meadows Plant. From 1959 to 1962, Tantanex Chemical Corp., producers of dye carriers, operated on the site. Following 1962, the property was owned by Standard Chlorine and Standard Naphthalene companies, which remained in operation until 1993 (ATSDR 2005: 1). The site has not been in active industrial use since that time.

This survey form solely addresses the portion of the Standard Chlorine Chemical Company property that was formerly part of the Thomas A. Edison Company/ Emark Battery Company property, including the southwestern portion of the present Standard Chlorine Chemical Company property. The remaining (northern) portion of the Standard Chlorine Chemical Company property, formerly owned by the White Tar Company, is addressed on a separate survey form.

A site visit was conducted on June 26, 2007, however, photography was prohibited. Therefore, the only photographs of the structures attached are aerial photographs (Figure 2), photographs taken from public rights-of-way (Figure 4), and historic photographs (Figures 5-7). Views of the site from surrounding public roads and rights of way are limited.

Thomas A. Edison Company and Emark Battery Corporation

Thomas A. Edison (1847-1931), one of the most prolific inventors in history, is best remembered as the inventor of the phonograph, developer of the light bulb, and the creator of the first industrial research laboratory, in Menlo Park. Edison also advanced cement as a building material, particularly in domestic applications, developing new techniques for cement processing and construction. Born in Ohio, Edison moved to New Jersey early in his career and remained closely associated with New Jersey for the rest of his life.

The battery represents another commodity which Edison was important in developing. Storage batteries were introduced on the commercial market in 1881. For over two decades, the only battery type available was a lead-sulphuric-acid cell, consisting of plates of lead in a dilute sulphuric-acid electrolyte. From the 1890s through the early 20th century, Edison strove to develop a powerful, durable, and light-weight alkaline car battery to become the basis for a successful electric automobile. Edison's laboratories continually refined the design of such a

CONTINUATION SHEET

Historic Sites #:

battery, striving to develop a new alkaline electrolyte that could be used in small quantities and which would be slower to dissolve metals in the battery, creating a long-lasting and light battery. In place of the sulphuric acid electrolyte solutions coupled with lead electrodes which were the contemporary standard, Edison's 'type A' battery used a potassium hydrate and lithium hydrate electrolyte and a nickel and iron electrode. Edison succeeded in developing a battery that met his expectations in 1910. It did not achieve the success he had hoped in the car market, however, due to Henry Ford's 1909 release of the gasoline-engine Model T. Nevertheless, it was widely used in trucks and commercial and factory vehicles and became one of his most lucrative inventions (IEEE 2007).

During the first two decades of the 20th century, Edison founded multiple companies involved in the development and production of batteries in the United States, including the Edison Manufacturing Company; the Battery Supplies Company (est. 1903); the Edison Storage Battery Company; and the Emark Battery Corporation. Edison also operated multiple battery companies in Germany. Thomas A. Edison, Incorporated, organized as the National Phonograph Company in 1896, and renamed in 1911, consolidated many of Edison's companies over time, including the Edison Storage Battery Company in 1932, and the Emark Battery Corporation in 1933. Edison established multiple battery factories, including a plant in West Orange (ca. 1910) and a chemical plant in Bloomfield (Israel 2000: 419). The Kearny battery factory, while purchased by Edison in 1916, was not developed and put into production until 1927, four years before his death.

Site History and Description

The former Edison Battery Company Property is located on the eastern side of the Belleville Turnpike in Kearny. The proposed boundaries of the potential historic resource site have been drawn to include only the portion of the former Edison Battery Company parcel (now part of the Standard Chlorine Chemical Company property) that include standing buildings that were historically associated with the Thomas A. Edison Company. The boundaries encompass the entirety of tax lot 287, block 50 (see Figures 1 and 2).

Five buildings currently stand on the former Edison Battery Company site. Historic maps, historic photographs, and documentary sources, as well as physical evidence suggest that all five of these structures were built as part of a single construction campaign of 1927 (this construction date is shown on a 1936 Sanborn map; see Figure 3) when the property was first developed by the Thomas A. Edison Company. The five buildings, with the exception of the Gate House, a small structure designed in the Spanish Eclectic style, are Art Deco-style structures that reflect functionality, aesthetic attention, and construction technology (see Figures 4-7). The Art Deco-style structures include a Laboratory; a Battery Manufacturing Building; a Service and Maintenance Building; and a Boiler House. According to the 1936 Sanborn map, batteries were manufactured, packed, and shipped in the Battery Manufacturing Building, the largest building on the site. The Office & Laboratory, the first building one encounters after the Gate House, upon entering the site, is the most ornate of the structures; constructed of fireproof concrete, with incised Art Deco decoration. The existence of a laboratory on an industrial site may be relatively unique to Edison's complexes in this period, reflecting of his role in combining research and development with manufacturing. The use of concrete throughout the complex also likely reflects Edison's interest in the building material; however whether Edison's concrete construction methods or concrete companies were involved in the construction of the buildings on the site is not known.

All of the buildings extant on the site today, are depicted on a 1936 Sanborn map, and are believed to have been built in 1927. Also depicted on the map is a 'sulphuric acid tank,' no longer standing on the site, and a small structure labeled 'storage,' located on the southern edge of the property, south of the Battery Manufacturing Building. The Sanborn map also indicates that a short spur of the Erie Railroad (Newark & Hudson Branch) ran on and east-west orientation along the southern property line. Furthermore, an underground 'Pipe Tunnel' is depicted, connecting the Office & Laboratory Building with the Battery Manufacturing Building.

Historic photographs on file at the National Parks Service, dating to March, 1930, show that the appearance of the site and buildings has not changed dramatically since that date. There have been some alterations, including the following: the cement entry wall designed in the Art Deco style, shown in the photographs, no longer stands today, having been replaced with a metal fence. Furthermore, the Boiler House is shown on the photographs with a tall brick smokestack bearing the word 'Emark;' this feature no longer stands. Most of the buildings on the site exhibit cracking or spalling of the concrete or stucco facing, and some of the windows are broken. However,

CONTINUATION SHEET

Historic Sites #:

overall, the exteriors of the buildings standing on the property retain a high degree of historic integrity. The interiors, with the exception of the Office & Laboratory Building, were not accessible. The present landscape of the property consists of a driveway, oriented east-west along the northern edge of the historic property line; the remainder of the site is largely paved. Historic photographs show that the driveway maintained its current configuration, and was edged in fieldstones, while the rest of the site was either paved or covered in grass.

Significance

The former Edison Battery Property complex appears to meet the criteria for State/National Register eligibility. The complex appears eligible under Criterion A, for its association with Thomas A. Edison and his development of the battery. It also appears eligible under Criterion C, as an example of the Art Deco style applied to industrial buildings.

Historic Sites #:

Common Name: Gatehouse (Standard Chlorine Chemical Company)
Historic Name: Gatehouse (Edison Battery Property)
Present Use: Vacant
Historic Use: Industrial
Construction Date: 1927 **Source:** Historic maps; Historic photographs (NPS Archives)
Alteration Date(s): **Source:**
Designer: Not known **Physical Condition:** Good
Builder: Not known **Remaining Historic Fabric:** High
Style: Spanish Colonial Revival
Form: Other **Stories:** One
Type: Other **Bays:** Three
Roof Finish Materials: Tile, Spanish
Exterior Finish Materials Concrete Block, Modern

Exterior Description:
The Gatehouse is a small single-story square-plan building constructed of concrete, with a hipped roof clad in Spanish tile (see Figure 4, Photo 1; and Figure 5). The front façade faces the driveway of the complex and is characterized by a central doorway with a window on either side. A window is also located in the center of each of the other facades of the building. The windows throughout the structure contain nine-light sash. The exterior of the building exhibits some spalling and cracking, and small modern lights and electrical fixtures have been appended to the side of the building, however, overall, the structure retains a high degree of physical integrity.

Interior Description:
Interior not accessible.

Setting:
The building is located on the east side of the Belleville Turnpike on the western edge of the Standard Chlorine Chemical Company property. The driveway for the facility runs east-west immediately north of the structure, and a metal entry gate abuts the front (north) façade of the Gatehouse.

Historic Sites #:

Edison Battery Property: Laboratory and Office Building Form

Exterior Description:

The Office & Laboratory building is a boxy two-story rectangular-plan building built ca. 1927 in the Art Deco style (see Figure 4, Photo 1; and Figure 6). It is constructed of concrete and has a high simple plinth and a shallow parapet around its flat roof.

Each of the building's four facades exhibit similar characteristics. They are symmetrically fenestrated, with central entries on the front (north), and west facades. On the latter facades, the entry bays are wider and contain paired windows at second-story level. Windows throughout the building are rectangular, with slightly shouldered lintels. Stylized fluted pilasters are placed between every two bays along the façades. A wide frieze band runs continuously around the building's cornice line. This frieze contains shallowly incised ornamentation consisting of floral and geometric patterns. Similar panels of incised patterning are located above the windows and doorways. Flanking the doorways are bulky pilasters suggesting amortized buttress. The bulk of these features and of the low bulky concrete walls flanking the steps that lead to the doorways, exhibit a vaguely Egyptian quality, suggested also by the pyramidal caps that surmount the pilasters. The latter are also decorated with vertical panels of incised patterning depicting scrolls and geometric shapes. Recessed square panels are located between first and second story windows.

The front (north) façade of the building has nine bays, symmetrically arranged. The central bay contains a doorway on the first story surmounted by a paired window. The doorway contains a modern glass double-door surmounted by a large square transom. The windows along the second story of the front façade have two-light fixed sash; a recessed area beneath the windows shows where longer original window openings (as shown in historic photographs) have been blocked. First-story windows on the front façade contain three-light fixed sash surmounted by a blind panel that was formerly a fourth light.

Similarly, occupying the windows along the side (west) façade contain three-light fixed sash, surmounted by a blind panel that was formerly a fourth light. The east façade of the building appears to contain some of the original awning sash windows, though the former location of the upper light has been blocked throughout the façade.

BUILDING ATTACHMENT

Historic Sites #:

Common Name: Battery Manufacturing Building (Standard Chlorine Chemical Company)
Historic Name: Battery Manufacturing Building (Edison Battery Property)

Designer: Not known **Physical Condition:** Fair
Builder: Not known **Remaining Historic Fabric:** High
Style: Art Deco
Form: Other **Stories:** Two
Type: Other **Bays:** Nine
Roof Finish Materials: Built-up Tar
Exterior Finish Materials Concrete Block, Modern

Exterior Description: The large rectangular-plan building is two-stories in height, has a flat roof, and is constructed of concrete parged with stucco (see Figure 4, Photo 2; and Figure 6, Photo 6; and Figure 7). The tripartite front (north) façade has a projecting three-bay central section flanked by recessed three-bay wings. It exhibits elements of the Art Deco and Second Egyptian Revival styles. It has a minimally stepped roof parapet, projecting and stepped wall segments, a recessed square panel above the central doorway, and stepped windows along the upper story. Windows contain multi-light iron casement and sash. Three windows on the structure have been blocked. The rear section of the building is constructed of stucco-parged concrete block, with continuous window panels on the upper portions of the side facades.

Interior Description:
Interior not accessible.

Setting:
The building is located east of the Office & Laboratory Building, in the southwestern portion of the Standard Chlorine Chemical Company property. The driveway for the facility runs east-west immediately north of the structure. The building is surrounded on each side by asphalt pavement.

Style: Art Deco
Form: Other **Stories:** One
Type: Other **Bays:** Five
Roof Finish Materials: Built-up Tar
Exterior Finish Materials Concrete Block, Modern

Exterior Description: The Service and Maintenance Building is similar in design to the neighboring Battery Building, though smaller (see Figure 7). The single-story flat-roofed concrete building is parged with stucco. The tripartite front (north) façade is symmetrical and has a single-bay central section flanked by shorter two-bay wings. The central entry, accessed by a double-entry stair with metal railing, is surmounted by a square panel and flanked by simple pilasters. The windows have chamfered upper edges and contain multi-light casement sash. The rear section of the building features large continuous multi-light fixed and awning-sash windows along the side facades. The central section is higher than the the wings, creating a tiered effect. The concrete structure exhibits some cracking, and a few of the window panes are broken, however, overall it appears to retain high integrity.

Interior Description:
Interior not accessible.

Setting:
The building is located east of the Battery Building, in the southwestern portion of the Standard Chlorine Chemical Company property. The driveway for the facility runs east-west immediately north of the structure. The building is surrounded on each side by asphalt pavement.

Former White Tar Products Company Property (Standard Chlorine Chemical Company): Base Form

Description:

General Historical Background

Following the development of the first railroads through the area in the 1860s and 1870s, eastern Kearny was transformed from undeveloped marshlands to a center of industry. The Mile End Thread Mills, Marshall Linen Thread Mills, and the Nairn Manufacturing Company, a linoleum factory, were among the large industries established in Kearny between the mid-1870s and the mid-1880s (Stinson 1915: 371).

The portion of eastern Kearny located south of the Pennsylvania Railroad (Northeast Corridor), along the west side of the Hackensack River became the site of multiple industrial facilities. The parcel located immediately south of the Northeast Corridor Line, now known as the Diamond Shamrock property, was first developed in 1916 by the Martin-Dennis Company, which produced sodium bichromate and potassium dichromate, chemicals used in the preparation of Tanolin, a leather tanning agent. A 1936 Sanborn map shows over a dozen buildings on the Martin-Dennis property (Sanborn 1936).

The White Tar Products Company, a subsidiary of the Koppers Company, purchased a long narrow parcel directly south of the Diamond Shamrock property, also in 1916, and probably shortly thereafter, constructed several buildings on the site for the refinement of crude naphthalene for the production of moth repellents, camphor flakes, disinfectants, and deodorizers. The White Tar Products Company property spanned the area between the Belleville Turnpike and the Hackensack River. A 1936 Sanborn map of the property shows that roughly sixteen buildings and numerous tanks for the storage of naphthalene were located on the site at this time. Of the buildings shown on the Sanborn map, eight are still extant. Also shown on the 1936 Sanborn, the Erie Railroad's Greenwood Lake Division transected the eastern portion of property, oriented north-south. A sidetrack apparently facilitated the transport of goods to and from the White Tar property.

In 1940, a fire broke out on the White Tar property, when stills for deriving naphthalene from tar exploded, "blowing the metal roof off the tile and brick building in which they were housed" and setting fire to "an adjoining warehouse where the barrels of naphthalene were stored" (*NYT* 1940: 27). The damage of the fire on the property was estimated at $250,000. The description of the fire printed in the *New York Times* suggests that it occurred on the eastern portion of the property, probably destroying the building labeled on the 1936 Sanborn as "Building No. 11/12" a brick and tile building immediately east of the railroad on the south edge of the property, and the "Bagging/White Pan Building (Building No. 1/2/3)," a large rectangular-plan building next to it. New structures were likely built on the sites of the destroyed buildings shortly after the fire. Presently, two buildings occupy the side of the Bagging/White Pan Building and another building occupies the site of former "Building No. 11/12." Another building replacement made since the 1936 Sanborn also depicts a large square-plan "Subliming Building (Building No.4)" on the far northeastern portion of the property. Two different structures currently occupy this site, however, the date of the Subliming Building's demolition and the construction of the two existing buildings is not known.

The Koppers Gas & Coke Company purchased the White Tar Company property (north of the Edison property) in 1942, and continued production of naphthalene products (ATSDR 2005: 3). Later, the Koppers Company purchased the Edison Battery Company property, a battery manufacturing plant which had occupied the parcel immediately south since 1917, and merged it with the White Tar Company property to create the Tar Products Division- Meadows Plant (*NYT* 1917: 16). From 1959 to 1962, Tantanex Chemical Corp., producers of dye carriers, operated on the site. Following 1962, the property was owned by Standard Chlorine and Standard Naphthalene companies, which remained in operation until 1993 (ATSDR 2005: 1). The site has not been in active industrial use since that time.

This survey form solely addresses the portion of the Standard Chlorine Chemical Company property that was formerly part of the Kopper's Company/ White Tar Products Company property, including the northern portion of the present Standard Chlorine Chemical Company property (see Figure 3). The southern portion of the Standard Chlorine Chemical Company property, formerly owned by the Edison Battery Company (Emark Battery Corp.), is addressed on a separate survey form.

CONTINUATION SHEET

Historic Sites #:

A site visit was conducted on June 26, 2007, however, photography was prohibited. Therefore, the only photographs of the structures attached are aerial photographs (Figures 1 and 2), and a photograph taken from a public right-of-way (Figure 4). Views of the site from surrounding public roads and rights of way are limited.

Site History and Description

The former White Tar Products Company Property is located on the east side of the Belleville Turnpike in Kearny. The site boundaries, consisting of the original property boundaries of the White Tar Products Company, include the entirety of tax lot 287, blocks 46 and 47 (see Figures 1, 2, and 3). The site currently contains fourteen buildings, which range in condition from fair to ruinous, and range in initial construction date from ca. 1916 to ca. 1950 (see Table 1, below, and Figure 4). A number of storage tanks are also located on the site. Tanks of similar size and layout appear on the 1936 Sanborn map, identified as “Disinfectant Tanks” and “Naphthalene Tanks.” The present tanks are not in the same location as the tanks on the historic map, and probably postdate 1936, but were likely built for similar functions.

Table 1
Extant Buildings on Former White Tar Products Company Property

Building ID	Former Name / No.*	Construction Date	Condition
1	Candle Packing & Storage (Building No. 26) and Garment Bag Mfg. (Building No. 25).	Ca. 1916	Fair
2	Sulphur Paste Drying (Building No. 27)	Ca. 1916	Ruinous
3	Naphthalene Storage (Building No. 23)	Ca. 1916	Poor
4	Naphthalene Storage (Building No. 21)	Ca. 1916	Poor
5	Building No. 19	Ca. 1916	Fair
6	Sulphur Candle Manufacturing (Building No. 22)	Ca. 1916	Fair
7	Not shown	Ca. 1950	Poor
8	Not shown	Ca. 1940	Fair
9	Not shown	Ca. 1940	Fair
10	Not shown	Ca. 1940	Fair
11	Still Building (Building No. 5)	Ca. 1916	Fair
12	Washer Building (Building No. 6)	Ca. 1916	Fair
13	Not shown	Ca. 1950	Fair
14	Not shown	Ca. 1950	Fair
* As depicted on 1936 Sanborn Fire Insurance Map			

Other buildings shown on the 1936 Sanborn map, (Figure 3), which no longer exist include a “Parafine Melting” building, a small rectangular-plan structure in the southwest portion of the property; a Pipe Shop/Boiler House Building (former Building No. 24), a square-plan building with a smokestack, located in the center of the property; a round-plan tile “Coal Shed” immediately south of the Pipe Shop/Boiler House; a “Paint Storage” building, former Building No. 20, immediately west of the railroad tracks; a small rectangular-plan tile building located south of the “Bagging/White Pan Building” discussed above; as well as the Subliming Building (former No. 4) and former Building No. 11/12, also discussed above.

The landscape of the former White Tar Products Company property is largely paved. A fence running along the former railroad right-of-way separates the eastern portion of the property from the western portion of the property. The eastern portion is partly paved, but largely overgrown with vegetation. The eastern edge of the property consists of a narrow rocky section of Hackensack River shoreline.

Significance

The former White Tar Products Company property does not appear to meet the State/National Register eligibility criteria. While the property is an industrial complex retaining multiple buildings that meet the age criterion for

CONTINUATION SHEET

Historic Sites #:

S/NR eligibility, the complex lacks the historic and architectural distinction and the historic integrity necessary for S/NR eligibility.

Form: Other **Stories:** Two
Type: Other **Bays:**
Roof Finish Materials: Other
Exterior Finish Materials Brick and Corrugated Steel

Exterior Description: The largest building on the site, Building No. 1 is composed of three sections (see Figures 2 and 3). The westernmost section (identified on the 1936 Sanborn as "Candle Packing & Storage: Building No. 26") is a two-story steel-frame structure with a wood-sheathed flat roof. The lower part of the first story is clad in red brick; the upper portions have continuous casement-sash windows. Doorways on the west and south facades are unornamented. The center section of the building, identified on the 1936 Sanborn map as "Garment Bag Manufacturing: Building No. 25," has a steel-frame and glass wall panels, most of which are now missing. The third section of the building (labeled 'Warehouse' on the 1936 Sanborn) is a single-story corrugated steel structure. Its form resembles four side-by-side quonset huts.

Interior Description:
Interior not accessible.

Setting:
The building is located on the east side of the Belleville Turnpike in the northern portion of the Standard Chlorine Chemical Company property. It is several hundred feet east of Belleville Turnpike, but is the westernmost structure on the former White Tar Products Company property. The landscape surrounding the building is paved in asphalt.

BUILDING ATTACHMENT

Historic Sites #:

Common Name: Building No. 2 (Standard Chlorine Chemical Company)
Historic Name: Sulphur Paste Drying (Building No. 27) (White Tar Products Company)
Present Use: Vacant
Historic Use: Industrial
Construction Date: ca. 1916 **Source:** Historic maps
Alteration Date(s): **Source:**
Designer: Not known **Physical Condition:** Ruinous
Builder: Not known **Remaining Historic Fabric:** Low
Style:
Form: Other **Stories:** One
Type: Other **Bays:**
Roof Finish Materials: None
Exterior Finish Materials None

Exterior Description:
Only the steel wall frame and wood roof frame of this single-story rectangular-plan structure remains, and even these elements are severely damaged (see Figures 2, 3, and 4). The wall and roof cladding are missing. The 1936 Sanborn map that shows the property labels the building as the "Sulphur Paste Drying, Building No. 27." The Sanborn also notes that the building was "gutted by fire." The building may, therefore, have been in ruinous condition since before 1936. Vegetation is growing in and around the structure.

Interior Description:
Interior not accessible.

Setting:
The building is located on the east side of the Belleville Turnpike in the northern portion of the Standard Chlorine Chemical Company property. It is located east of Building No. 1 on the former White Tar Products Company property. The landscape surrounding the building is paved in asphalt.

BUILDING ATTACHMENT

Historic Sites #:

Common Name: Buildings No. 3, 4, and 5 (Standard Chlorine Chemical Company)
Historic Name: Naphthalene Storage (Building Nos. 23, 21, and 19) (White Tar Products Company)
Present Use: Vacant
Historic Use: Industrial
Construction Date: ca. 1916 **Source:** Historic maps
Alteration Date(s): **Source:**
Designer: Not known **Physical Condition:** Ruinous
Builder: Not known **Remaining Historic Fabric:** Low
Style:
Form: Other **Stories:** One
Type: Other **Bays:**
Roof Finish Materials: Not known
Exterior Finish Materials Other

Exterior Description:
Buildings No. 3, 4, and 5 (former Buildings 23, 21, and 19, respectively), all originally used for naphthalene storage, are rectangular-plan buildings with wood-sheathed gable roofs (see Figures 2, 3, and 4). They have similar designs, but differ slightly in size, Building No. 3 being the largest, Building No. 4 slightly smaller, and Building No. 5, the smallest. Buildings No. 3 and 4 have cinderblock foundations and are clad in metal sheets. They have large casement-sash windows. Most of the window light are broken, and most of the doors are missing. The roofs contain raised metal skylights. Building No. 5 is constructed of cinderblocks and has no visible windows.

Interior Description:
Interior not accessible.

Setting:
The buildings are located on the east side of the Belleville Turnpike in the northern portion of the Standard Chlorine Chemical Company property. They are located east of Building No. 2 on the former White Tar Products Company property. The landscape surrounding the building is paved in asphalt.

BUILDING ATTACHMENT

Historic Sites #:

Common Name: Building No. 6 (Standard Chlorine Chemical Company)
Historic Name: Sulphur Candle Manufacturing (White Tar Products Company)
Present Use: Vacant
Historic Use: Industrial
Construction Date: ca. 1916 **Source:** Historic map
Alteration Date(s): **Source:**
Designer: Not known **Physical Condition:** Poor
Builder: Not known **Remaining Historic Fabric:** Moderate
Style:
Form: Other **Stories:** One
Type: Other **Bays:** Three
Roof Finish Materials: Not known
Exterior Finish Materials Wood clapboard

Exterior Description:
Building No. 6 is a single-story wood-frame structure with a flat roof and overhanging eaves (see Figures 2 and 3). A building appears on the site on the 1936 Sanborn map of the property, labeled "Sulphur Candle Manufacturing: Building No. 22." The plan of the structure on the map appears slightly different from that of the present structure, suggesting that the present building may have been built or altered at a later date. The building is clad in wood clapboard. Missing claboards reveal that it is sheathed with diagonal boards. The building contains several doorways, however, the doors are missing. Multiple large nine-light fixed-sash windows are also located on the structure, most of the lights are broken or missing.

Interior Description:
Interior not accessible.

Setting:
The structure is located on the east side of the Belleville Turnpike in the northern portion of the Standard Chlorine Chemical Company property. It is located south of Building No. 5 on the former White Tar Products Company property. The landscape surrounding the building is paved in asphalt.

Designer: Not known **Physical Condition:** Poor
Builder: Not known **Remaining Historic Fabric:** Moderate
Style:
Form: Other **Stories:** One
Type: Other **Bays:** One
Roof Finish Materials: Asphalt shingle
Exterior Finish Materials Corrugated steel

Exterior Description:
The structure is a small square-plan shed or booth, clad in corrugated metal, with a hipped roof clad in asphalt shingles (see Figure 2). The building does not appear on the 1936 Sanborn map of the property and its original function is not known. The structure contains no windows, and there is one doorway on its south façade. There is no door. The roof of the structure is in a deteriorated condition.

Interior Description:
Interior not accessible.

Setting:
The structure is located on the east side of the Belleville Turnpike in the northern portion of the Standard Chlorine Chemical Company property. It is located east of Building No. 5 on the former White Tar Products Company property. The landscape surrounding the building is paved in asphalt.

BUILDING ATTACHMENT

Historic Sites #:

Common Name: Buildings No. 8, 9, and 10 (Standard Chlorine Chemical Company)
Historic Name: None known (White Tar Products Company)
Present Use: Vacant
Historic Use: Industrial
Construction Date: ca. 1940 **Source:** Historic maps; newspaper articles
Alteration Date(s): **Source:**
Designer: Not known **Physical Condition:** Fair
Builder: Not known **Remaining Historic Fabric:** High
Style:
Form: Other **Stories:** Two
Type: Other **Bays:** Four
Roof Finish Materials: Corrugated steel
Exterior Finish Materials Corrugated steel; Brick

Exterior Description: Building No. 8 is a large industrial building, clad in corrugated metal (see Figures 2 and 4). It consists of a tall central section with a gable roof, resembling a silo, flanked by single-story shed-roofed wings. On the lower portion of the first story and the upper portion of the second story are apertures containing multi-light casement sash windows. A metal conveyer system connects between the second story of Building No. 8 and the second story of Building No. 10, passing over the roof of Building No. 9, between them. Building No. 9 is a single-story rectangular-plan structure, clad in corrugated metal, with a gable roof. Building No. 10 is a two-story flat-roofed brick building, with large metal roof vents. It has large multi-light casement sash windows; most of the lights are broken. The buildings do not appear on the 1936 Sanborn, and likely replaced structures destroyed by fire in 1940.

Interior Description:
Interior not accessible.

Setting:
Buildings No. 8, 9, and 10 are located on the east side of the Belleville Turnpike in the northern portion of the Standard Chlorine Chemical Company property. They are located on the eastern third of the former White Tar Products Company property; this section is separated from the rest of the property by a fence, and is largely overgrown with vegetation.

Historic Use: Industrial
Construction Date: ca. 1940 **Source:** Historic map
Alteration Date(s): **Source:**
Designer: Not known **Physical Condition:** Fair
Builder: Not known **Remaining Historic Fabric:** High
Style:
Form: Other **Stories:** Seven
Type: Other **Bays:** One
Roof Finish Materials: Corrugated steel
Exterior Finish Materials Corrugated steel

Exterior Description:
Building No. 11 appears to match the footprint of a structure identified on the 1936 Sanborn map as the "Still Building: Building No. 5" (Figures 2, 3, and 4). The structure would likely have been used to distill naphthalene from tar. The structure is characterized by a high gable-roofed central section, resembling a silo, with seven stories of multi-light casement-sash windows. This section is flanked by single-story shed-roofed wings which appear to be two stories in height and contain multi-light windows. The structure is clad in corrugated metal.

Interior Description:
Interior not accessible.

Setting:
Building No. 11 is located on the east side of the Belleville Turnpike in the northern portion of the Standard Chlorine Chemical Company property. It is located on the eastern third of the former White Tar Products Company property, east of Building 10. The eastern section of the property is separated from the rest of the property by a fence, and is largely overgrown with vegetation.

Present Use: Vacant
Historic Use: Industrial
Construction Date: ca. 1916 **Source:** Historic map
Alteration Date(s): **Source:**
Designer: Not known **Physical Condition:** Fair
Builder: Not known **Remaining Historic Fabric:** Moderate
Style:
Form: Other **Stories:** Two
Type: Other **Bays:** One
Roof Finish Materials: Not known
Exterior Finish Materials Concrete Block, modern

Exterior Description:
Building No. 12 is a two-story rectanglar-plan structure with a single-story addition appended on the east (see Figures 2, 3, and 4). It appears to be constructed of concrete block, parged in stucco. It contains several multi-light windows, irregularly placed. As seen on a current aerial map, two large round apertures on the roof appear to be the locations of former metal roof vents. The structure appears on the 1936 Sanborn map, labeled "Washer Building: No. 6." The map shows only the two-story section of the building. The east addition was apparently added at a later date.

Interior Description:
Interior not accessible.

Setting:
Building No. 12 is located on the east side of the Belleville Turnpike in the northern portion of the Standard Chlorine Chemical Company property. It is located on the eastern third of the former White Tar Products Company property, east of Building 11. The eastern section of the property is separated from the rest of the property by a fence, and is largely overgrown with vegetation.

BUILDING ATTACHMENT

Historic Sites #:

Common Name: Buildings No. 13 and 14 (Standard Chlorine Chemical Company)
Historic Name: None known (White Tar Products Company)
Present Use: Vacant
Historic Use: Industrial
Construction Date: ca. 1950 **Source:** Historic map
Alteration Date(s): **Source:**
Designer: Not known **Physical Condition:** Fair
Builder: Not known **Remaining Historic Fabric:** High
Style:
Form: Other **Stories:** Two
Type: Other **Bays:** Nine
Roof Finish Materials: Built-up tar
Exterior Finish Materials Concrete Block, modern

Exterior Description:
Buildings No. 13 and 14, almost identical and located side by side, are large but low two-story rectanglar-plan structures with flat roofs (see Figures 2 and 4). They appear to be constructed of concrete block, parged in stucco. They are nine bays wide on the east and west facades and contain central doorways; they are five bays wide on the north and south facades; and are fairly symmetrically fenestrated. The structures appear on the site of a single square-plan "Subliming Building" (former Building No. 4) shown on the 1936 Sanborn map. The date that these buildings replaced the Subliming Building is not clear.

Interior Description:
Interior not accessible.

Setting:
Buildings No. 13 and 14 are located on the east side of the Belleville Turnpike in the northern portion of the Standard Chlorine Chemical Company property. They are located on the eastern third of the former White Tar Products Company property, north of Building No. 12. Building No. 14 is located immediately east of Building No. 13, close to the western bank of the Hackensack River. The eastern section of the former White Tar Products Company property is separated from the rest of the property by a fence, and is largely overgrown with vegetation.

P.O. Box 404
Trenton, NJ 08625-0404

Re: **Portal Bridge Capacity Enhancement Project – Draft Environmental Impact Statement**
Hudson County, New Jersey

Dear Ms. Guzzo:

As you know, the National Railroad Passenger Corporation (Amtrak) and the New Jersey Transit Corporation (NJ TRANSIT) are proposing capacity enhancements to the Hackensack River crossing of the Northeast Corridor including the New Jersey State Register (SR) listed Portal Bridge. The project sponsors are seeking approvals from the Federal Railroad Administration (FRA), and as such, a Draft Environmental Impact Statement (DEIS) is being prepared in accordance with the National Environmental Policy Act (NEPA) (as amended). Additionally, the project will be subject to the New Jersey Register of Historic Places Act; Section 4(f) of the United States Department of Transportation (DOT) Act; and Section 106 of the National Historic Preservation Act (NHPA) of 1966 (as amended).

At this time, in compliance with Section 106 of the National Historic Preservation Act, FRA is providing for your review and comment the following draft documentation that presents determinations of effect on historic resources:

(a) Preliminary draft of the Historic Resources chapter (Chapter 5.2) of the Portal Bridge Capacity Enhancement Project Draft Environmental Impact Statement (DEIS);

(b) Draft Memorandum of Agreement (MOA) among the FRA, Amtrak, NJ TRANSIT, and New Jersey Historic Preservation Officer regarding the Portal Bridge Capacity Enhancement Project.

(c) Preliminary draft of Appendix B-1 to the DEIS, "Historic Resources: Background History and Review of Previously Conducted Surveys;"

We look forward to receiving your comments on these documents. Please do not hesitate to contact Mr. David Valenstein of this office at (202) 493-6368 if you have any questions or concerns.

Sincerely,

Mark E. Yachmetz
Associate Administrator

Washington, D.C. 20590

Dear Mr. Yachmetz:

I am writing in response to your letter, received in this office on December 3, requesting continuing consultation for the **Portal Bridge Capacity Enhancement Project—Draft Environmental Impact Statement, Hudson County, NJ**. I thank you for providing further explanation for the rationale of the architectural Area of Potential Effects (APE). The explanation for the boundaries is sufficient.

In addition, you included New Jersey Historic Structure Inventory forms for two properties located within the architectural APE, the former **White Tar Products Company Property** and the former **Edison Battery Company Property**, both of which are currently part of the Standard Chlorine Chemical Company Property in Kearney, N.J.

The former **Edison Battery Company Property** is a complex of five buildings associated with prolific inventor Thomas A. Edison and with refinements in battery development. The buildings were designed in the Art Deco style and were constructed in 1927 of concrete. The Gatehouse, Laboratory and Office, Battery Manufacturing Building, Service and Maintenance Building and Boiler House reflect Edison's belief in "combining research and development with manufacturing."

The buildings appear to be in good to fair physical condition and retain integrity. As Deputy State Historic Preservation Officer, I concur with your opinion that the former **Edison Battery Company Property** appears to meet the criteria for listing in both the New Jersey and National Registers of Historic Places. The property is eligible for listing under Criterion A, for its association with Thomas A. Edison and his development of the battery; and under Criterion C, as an example of the Art Deco style applied to industrial buildings.

You have also requested concurrence with your opinion that the former **White Tar Products Company Property** is not eligible for listing in the National Register of Historic Places. While the property does not appear to have any special historical significance and the integrity of the property appears to be diminished, photographs of the surviving buildings, like those of the Edison Battery Company Property, are needed to permit the Historic Preservation Office to make a definitive opinion of ineligibility.

If you have any questions, please contact Charles Scott at (609) 633-2396 or Charles.Scott@dep.state.nj.us

Sincerely,

Terry Karschner
Acting Administrator &
Deputy State Historic Preservation Officer

Log #05-2386-8
HPO-E2008-128

Dear Dara,

I understand from speaking to Charles Scott that he, Molly, and Patty discussed HPO's comments about the architectural history portion of the draft MOA and draft EIS chapters in a meeting held last Tuesday, May 6th. Charles explained to me that you were planning to address the HPO's comments in a revised document, and submit that revised document to the HPO for review. In consideration of this and the fact that I was unable to attend last Tuesday's meeting, I am providing the following comments regarding the draft MOA and draft EIS chapters:

1) Following the guidance provided at 36 CFR Part 800.14(b) and in consideration of the need to submit an Application for Project Authorization under the New Jersey Register of Historic Places Act, the agreement document should be called a Programmatic Agreement rather than a Memorandum of Agreement. The HPO recommends that the title of the agreement be changed to reflect this.

2) On page MOA-5, Stipulation V.C.1. states that the Disinterment/Reinterment Plan would be prepared in accordance with 36

CFR Part 800. The HPO is unclear about the intent of this sentence, and requests clarification. The HPO requests that, at a minimum, this stipulation be revised to include a provision for the Disinterment/Reinterment Plan to conform to the Secretary of the Interior's Standards for Archaeological Documentation.

3) On Page MOA-5, Stipulation V.C.6. states that "Subsequent to disinterment and re-interment," Amtrak and NJ Transit will provide a technical report FRA and NJHPO. The HPO suggests inserting a relative time frame in this clause. For example, the insertion of wording such as "Within 2 years after the completion of disinterment and re-interment, Amtrak and NJ Transit shall provide a technical report..." facilitates the monitoring of the terms of the agreement in the future.

4) On Page MOA-6, the language in Stipulation V.D.3. should be more specific regarding the development of interpretive materials. The current wording may be problematic for future monitoring of the agreement. The HPO suggests that the agreement could include a provision for the development of a plan for creating and providing interpretive materials to the public. This plan would be submitted to the HPO and FRA for review and approval. The stipulation in the agreement would then have to specify that Amtrak and NJ Transit would implement this plan. Alternatively, the plan for developing and providing interpretive materials to the public could be part of the Disinterment/Re-interment plan. (If this is the preferred way to go, this would have to be specified in the appropriate section of the agreement document.)

5) On Page MOA-6, Stipulation V.E. references the development of an unanticipated discoveries plan. Will the HPO be provided with the opportunity to review and comment on the unanticipated discoveries plan? Is this what is meant by the words "in consultation with FRA and NJHPO" in this stipulation?

6) On Page MOA-6, Stipulation V.G. references Secretary of the Interior's Professional Qualifications Standards, but does not reference the particular qualification standard that must be met. In addition, the stipulation references reporting format standards that have been superceded by the Secretary of the Interior's Standards for Archeological Documentation. The HPO requests that this stipulation be revised as follows, "Amtrak and NJ Transit shall ensure that all archaeological research, testing, analysis, and plans conducted pursuant to this Agreement are carried out by or under the direct supervision of a person or persons meeting at a minimum the Secretary of the Interior's Professional Qualifications Standards for archeology. Amtrak and NJ Transit shall ensure that all final reports are consistent with the NJHPO's Guidelines for Preparing Cultural Resources Management Archaeological Reports Submitted to the Historic Preservation Office and to the Secretary of the Interior's Standards for Archeological Documentation.

7) Terry Karschner has replaced Dorothy Guzzo as the Deputy State Historic Preservation Officer for New Jersey. This change should be reflected in the document, specifically on pages MOA-8 and MOA-10.

In addition to the above, I have read through the draft EIS chapters regarding historic properties, and find them to be acceptable, as prepared.

Thank you for your consideration in this matter. Could you please

forward this e-mail to Molly MacDonald of AKRS? Please do not hesitate to contact me if you have any questions.

Sincerely,
Kate Marcopul

Re: **Portal Bridge Capacity Enhancement Project**

Hudson County, New Jersey

Dear Ms. Harris:

In February 2008, a copy of the Draft Environmental Impact Statement (DEIS) for the Portal Bridge Capacity Enhancement Project was sent to your office. The Federal Railroad Administration (FRA) is the lead federal agency for the Project, which is a joint effort of the National Railroad Passenger Corporation (Amtrak) and the New Jersey Transit Corporation (NJ TRANSIT). The proposed Project involves capacity enhancements and operational improvements to the Hackensack River crossing of the Northeast Corridor including replacement of the National Register eligible and New Jersey State Register (SR)-listed Portal Bridge and is likely to rely upon federal funds to some degree. As per Section 800.6 of 36 CFR Part 800, this letter serves to officially notify the Advisory Council on Historic Preservation of the Project's adverse effect on historic resources. Project information as specified in Section 800.11 (e) is summarized below:

1) Description of the Undertaking

The existing Portal Bridge is a two-track, moveable swing-span bridge that was constructed by the Pennsylvania Railroad (PRR) and began operation in 1910. Owned by Amtrak, the bridge is a bottleneck along the Northeast Corridor that conflicts with marine traffic and impedes efficient and reliable passenger rail service. The Portal Bridge Capacity Enhancement Project examines four build alternatives in addition to the "no build" scenario. The build alternatives, which were identified through a comprehensive alternatives development and screening process, each involve the construction of two new bridges that would replace the existing bridge. The alternatives differ primarily with respect to the location of the southern bridge and the type of grade-separated crossing, either track fly-over or duck-under, included to improve railroad operations. Revenue service would begin between 2017 and 2019, depending on the build alternative. All of the proposed alternatives would result in the decommissioning and removal of the SR-listed, NR-eligible Portal Bridge. As required by Section 106 of the National Historic Preservation Act (NHPA) of 1966, FRA, Amtrak, and NJ TRANSIT have participated in an ongoing consultation process with the NJHPO with respect to potential effects on archaeological and architectural resources.

Analysis and documentation has been prepared in accordance with Section 106, Section 4(f) of the United States Department of Transportation (DOT) Act, and with the New Jersey Register of Historic Places Act. The DEIS Chapter 5.2, Historic Resources, identifies the project's area of potential effect (APE), considers the potential of the proposed project to affect historic resources in the project's APE, and lists identified mitigation measures.

2) Identification of Historic Properties

The Area of Potential Effect (APE) was initially identified in correspondence sent to Dorothy Guzzo of NJHPO on February 27, 2007 and May 30, 2007, copies of which are being submitted to you at this time. The methodology used to assess the potential effects of the Portal Bridge project on historic resources is included in the DEIS Chapter 5.2, Historic Resources.

3) Description of the Affected Historic Properties

Please see the Chapter 5.2 of the DEIS, "Historic Resources," which identifies historic resources, including architectural and archaeological resources that could be affected in the APE.

4) Description of the Undertaking's Effects on Historic Properties

All of the build alternatives are expected to result in modifications of the Northeast Corridor (a.k.a. Pennsylvania Railroad Historic District [S/NR-eligible]) within the APE. All of the build alternatives would also require the decommissioning and removal of the existing Portal Bridge (SR-listed; NR-eligible). The project also has the potential to impact portions of a State/National Register-eligible archaeological resource, the Hudson County Cemeteries archaeological site in Secaucus, although existing data indicates that the site would not be affected. Any indirect construction-period impacts on historic resources in the vicinity of proposed construction (including the State/National Register-eligible Substation 4 and Jersey City Waterworks Pipeline) would be avoided through the creation and implementation of a Construction Protection Plan. Please see the DEIS, Chapter 5.2, "Historic Resources," and Chapter 7, "Secondary and Cumulative Impacts," which identifies in greater detail the effects of the proposed project on identified historic resources and areas of archaeological sensitivity.

5) Adverse Effect Determination

As described in the DEIS, the proposed project would have an adverse impact on the S/NR-eligible Pennsylvania Railroad Historic District and the SR-listed, NR-eligible Portal Bridge. The proposed project also has the potential to adversely affect the S/NR-eligible Historic Cemeteries of Hudson County archaeological site. A memorandum of agreement (MOA) has been prepared to address treatment of affected historic and archeological resources. The MOA has been reviewed by the NJHPO and will be executed shortly.

6) Correspondence with Consulting Parties/Public and the New Jersey Historic Preservation Office

Consulting parties were selected based in part on stakeholders identified as part of the Section 106 compliance process for NJ TRANSIT's Access to the Regions Core Project (*ARC:DEIS*, 2006) and consultation with NJHPO. The following records regarding consulting parties are enclosed:

- Letter to NJHPO from February 27, 2007 initiating the Section 106 Process, providing draft Historic Resources materials and a draft MOA among FRA, Amtrak, NJ TRANSIT and NJHPO.
- Invitation to Consulting Parties from April 17, 2007 for a Section 106 Consulting Parties Meeting.
- Letter to NJHPO from April 23, 2007 proposing a public participation plan and a list of parties invited to participate in the Section 106 process as Consulting Parties.
- Letter to NJHPO from May 30, 2007 modifying the APE boundaries.

- Response from NJHPO from June 29, 2007 with initial consultation comments regarding Section 106 initiation and proposed methodology, APE delineation, public outreach plan, and list of potential consulting parties.
- Letter to NJHPO from November 28, 2007, including two New Jersey Historic Structure Inventory forms documenting two historic properties within the APE.
- Letter to NJHPO from February 6, 2008 providing draft Historic Resources materials and a draft MOA among FRA, Amtrak, NJ TRANSIT and NJHPO.
- Letter from NJHPO from April 8, 2008 with determinations of State/National Register of Historic Places eligibility for historic resources identified in the DEIS.
- Letter from NJHPO from May 15, 2008 with comments on the DEIS pertaining to Archaeological Resources.

A CD copy of the DEIS is also enclosed for your convenience. Please do not hesitate to contact Mr. David Valenstein of this office if you have any questions or need further clarification. He may be reached at (202) 493-6368, or by email at david.valenstein@dot.gov

APPENDIX C: ECOLOGY

C-1: Essential Fish Habitat Assessment

C-2: Ecology Agency Correspondence

C-3: Coastal Zone Management Agency Correspondence

Appendix C-1

Essential Fish Habitat Assessment

Portal Bridge Capacity Enhancement Project
Hudson County, New Jersey
Essential Fish Habitat Assessment

A. INTRODUCTION

Essential fish habitat (EFH) is defined under the Magnuson-Stevens Fishery Conservation Management Act (16 USC §§ 1801 to 1883), as amended by the Sustainable Fisheries Act (SFA) of 1996, as "those waters and substrate necessary to fish for spawning, breeding, feeding, or growth to maturity." "Waters" include aquatic areas and their physical, chemical and biological properties that are used by fish. "Substrate" includes sediment, hard bottom, structures, and associated biological communities that are under the water column. Waters and substrates necessary for fish spawning, breeding, feeding or growth to maturity—covering all stages within the life cycle of a particular species—refers to those habitats required to support a sustainable fishery and a particular species' contribution to a healthy ecosystem (50 CFR 600.10).

Section 303(a)(7) of the Magnuson-Stevens Act requires that the eight Regional Fishery Management Councils (RFMC) describe and identify EFH for each Federally managed species, and minimize adverse impacts from fishing activities on EFH. Section 305(b)(2)-(4) of the Magnuson-Stevens Act outlines the process for providing the National Marine Fisheries Service (NMFS) within the National Oceanic and Atmospheric Administration (NOAA), and the RFMC with the opportunity to comment on activities proposed by Federal agencies that have the potential to adversely impact EFH areas. Federal agencies are required to consult with NMFS (using existing consultation processes for NEPA, the Endangered Species Act, or the Fish and Wildlife Coordination Act) on any action that they authorize, fund, or undertake that may adversely impact EFH.

Adverse effects to EFH, as defined in 50 CFR 600.910(A) include any impact that reduces the quality and/or quantity of EFH. Adverse effects may include:

- Direct impacts such as physical disruption or the release of contaminants;
- Indirect impacts such as the loss of prey, reduction in the fecundity (number of offspring produced) of a managed species; and
- Site-specific or habitat-wide impacts that may include individual, cumulative, or synergetic consequences of a Federal action.

An EFH assessment of a Federal action that may adversely affect EFH must contain:

- A description of the proposed project;
- An analysis of the effects, including cumulative effects, on EFH, the managed species and associated species such as major prey species, and the life history stages that may be affected;

- The agency's conclusions regarding the effects of the action on EFH; and
- Proposed mitigation, if applicable (50 CFR 600.920(g)).

The following sections describe:

- The project actions that have potential to affect aquatic resources at the Portal Bridge Capacity Enhancement Project (the proposed project);
- Existing water and sediment quality within the tidal Hackensack River, where the project is located;
- Potential impacts to aquatic biota and habitat that may result from the proposed project activities;
- The species for which EFH has been identified near the proposed project and potential impacts to their habitats; and
- Potential impacts to one non-EFH species, shortnose sturgeon, a federal and state-listed endangered species, and four species of marine turtles with the potential to occur in the vicinity of the project as seasonal transients.

B. PROJECT DESCRIPTION

OVERVIEW

The project involves the reconstruction and or augmentation of Amtrak's Portal Bridge, an approximately 961-foot railroad bridge spanning the Hackensack River and associated wetlands. A detailed description of project Alternatives is provided in Chapter 3, "Project Alternatives."

SITE DESCRIPTION

The existing project area extends along Amtrak's northeast corridor from the east bank of the Passaic River in Newark, NJ to Secaucus Junction in Secaucus, NJ (Figure 3-1). The project area is approximately bounded by the city of Newark, NJ to the west, the New Jersey Turnpike's Eastern Spur to the north, Secaucus, NJ to the east, and the Morris and Essex rail lines to the south. This project area encompasses the maximum area of project disturbance for all project alternatives.

SURFACE WATER RESOURCES IN THE PROJECT AREA

The Hackensack River is the most prominent ecological feature in the project area. The river is approximately 45 mi (72 km) long, flowing through New York and New Jersey, and ultimately discharging into Newark Bay (a sub-estuary of New York Harbor). The Hackensack watershed includes part of the New York City suburban area west of the lower Hudson River, which it roughly parallels, and is separated from it by the New Jersey Palisades. The river flows through and drains the New Jersey Meadowlands. The lower river, which is navigable as far as the community of Hackensack, is heavily industrialized and forms a commercial extension of Newark Bay.

WATER QUALITY

Surface Water Quality Standards for New Jersey Waters are designated in N.J.A.C. 7:9 B. The Surface Water Quality Standards establish the designated uses to be achieved and specify the

water quality criteria necessary to protect the State's waters. Designated uses include potable water, propagation of fish and wildlife, recreation, agricultural and industrial supplies, and navigation. These are reflected in use classifications assigned to specific waters. The Hackensack River is designated Use Class SE2. In all SE2 waters, the designated uses are:

- Maintenance, migration and propagation of the natural and established biota;
- Migration of diadromous fish;
- Maintenance of wildlife;
- Secondary contact recreation; and
- Any other reasonable uses.

Tidal tributaries in the project area are designated Use Class FW2-NT/SE2. The FW2 general surface water classification is applied to those fresh waters that are not designated as FW1 or pineland waters. The NT designation indicates that the tributaries are not trout waters, and the SE2 designation is defined above. In all FW2 waters the designated uses are:

- Maintenance, migration and propagation of the natural and established biota;
- Primary and secondary contact recreation;
- Industrial and agricultural water supply;
- Public potable water supply after conventional filtration treatment (a series of processes including filtration, flocculation, coagulation, and sedimentation, resulting in substantial particulate removal but no consistent removal of chemical constituents) and disinfection; and
- Any other reasonable uses.

As of 2006, the Hackensack River in the project area was in non-attainment of Surface Water Quality Standards for New Jersey Waters for aquatic life (general) and for fish consumption. Waters below the Amtrak Portal Bridge are in full attainment for industrial water supply. Insufficient data exist to designate attainment status for the Hackensack River near the project area for primary and secondary contact recreation, drinking water supply, or agricultural water supply (NJDEP 2006).[1]

SEDIMENT QUALITY

The New York Harbor Estuary and its tributaries have had a long history of industrialization along its shores. This legacy of pollution continues to affect water quality as pollutants residing mostly in the sediments are dissolved and redistributed. This is an important point; in a tidally mixed water body, water exchange with the Atlantic Ocean tends to dilute waterborne contaminants, but the historically degraded sediments continue to provide new contaminants that affect water quality. Thus, the water quality of the system is coupled tightly to the quality of sediments, but can also be affected by other sources (e.g., industrial discharges).

Many area sediments contain low concentrations of contaminants such as heavy metals, PCB’s, PAHs, and other organic compounds. Sediments nearest former (or active) industrial sites may

[1] New Jersey Department of Environmental Protection (NJDEP). New Jersey Integrated Water Quality Monitoring and Assessment Report. Trenton, NJ. December 2006.

exhibit much higher local concentrations, and can result in localized areas of high contaminant concentrations colloquially as "hot spots". Landfills (either active or closed) abut many of the region's waterways, and also may leach contaminants into the waters. In addition, many former wetlands throughout the region have been filled with a mixture of materials including municipal waste and incinerator ash. Lastly, combined sewer outfalls (CSOs) can contribute significantly to regional pollution by introducing fecal coliform bacteria, floatable debris, and other contaminants.

Recent sediment quality investigations near the project area have revealed the presence of a number of contaminants present in Hackensack Meadowlands sediments, including chromium, lead, arsenic, mercury, 4,4'-DDE (a pesticide), flouranthane, pyrene, anthracene, and many others (Barrett and Mcbrien 2007).[1] Other investigators have identified a similar suite of contaminants, all within a few river miles of the project site (e.g., Weis et al. 2004,[2] Sorensen et al. 2007,[3] Bonnevie et al. 1993[4]).

C. EFH DESIGNATIONS

Table 1 lists the species for which Essential Fish Habitat has been designated in the estuary of Hudson River / Raritan Bay / Sandy Hook Bays in New York and New Jersey, The proposed action is located within the mixing zone (M) of the estuary (http://www.nero.noaa.gov/hcd/salinityzones.pdf).

D. POTENTIAL IMPACTS TO EFH

GENERAL DISCUSSION OF AQUATIC IMPACTS TO WATER QUALITY AND AQUATIC BIOTA FROM THE PROPOSED PROJECT

CONSTRUCTION

In-water project elements necessary to support the build Alternatives, such as pile installation, have the potential to result in temporary adverse impacts to fish and macroinvertebrates due to the following:

- increases in suspended sediment;
- noise associated with pile driving; and
- loss of benthic habitat within pile footprints

The project site spans the Hackensack River, and would be strongly influenced by tidal currents. Any temporary sediment resuspension associated with pile driving would be localized (rather than widespread) to the project site. This sediment would be expected to dissipate shortly after the completion of the sediment disturbing activity and would not be expected to result in significant adverse impacts to water quality or aquatic biota. Sediments throughout the Harbor Estuary contain contaminants. While Hackensack River sediments have been found to contain contaminants at concentrations that may pose a risk to some benthic macroinvertebrates, the tidal currents within the project area should dissipate these sediments such that redeposition within or outside the project area would not be expected to adversely affect benthic macroinvertebrates or bottom fish. Furthermore, sediment resuspension will be mitigated against through the use of silt curtains or other appropriate technologies during the period of disturbance.

Life stages of estuarine-dependent and anadromous fish species, bivalves and other macroinvertebrates generally are tolerant of elevated suspended sediment concentrations and have evolved behavioral and physiological mechanisms for dealing with variable concentrations of suspended sediment (Birtwell et al. 1987,[1] Dunford 1975,[2] Levy and Northcote 1982,[3] and Gregory 1990 in Nightingale and Simenstad 2001,[4] LaSalle et al. 1991[5]). Fish are mobile and

generally avoid unsuitable conditions such as increased suspended sediment and noise (Clarke and Wilber 2000[1]). While a localized increase in suspended sediment may cause fish to temporarily avoid the area where bottom disturbing activities are occurring, the affected area would be expected to be small. Similar nearby suitable habitats would be available for use by fish to avoid the area being disturbed. Many estuarine fish species also have the ability to expel materials that may clog their gills when they return to cleaner, less sediment-laden waters. The shellfish species found in the Hackensack River are necessarily adapted to naturally turbid estuarine conditions and can tolerate short-term exposures by closing valves or reducing pumping activity. Mobile benthic invertebrates that occur in estuaries have been found to be tolerant of extremely elevated suspended sediment concentrations. In studies of the tolerance of crustaceans exposed to suspended sediments for up to two weeks, nearly all mortality was caused by the full-time exposure to high suspended sediment concentrations (greater than 10,000 mg/L) (Clarke and Wilber 2000[2]), which would not occur from the in-water work associated with the proposed project (except perhaps extremely locally). Therefore, temporary increases in suspended sediment resulting from in-water construction activities would not be expected to result in significant adverse impacts to fish and mobile benthic macroinvertebrates.

The installation of in-water bridge supports (i.e. caissons and/or piers) is expected to be accomplished by drilling into the bottom rather than through the use of impact pile driving. Caisson drilling radiates significantly less noise into the aquatic environment than pile driving. Nevertheless, because the effects of impact pile driving on living marine resources are comparatively well studied, the possible effects of the noise of pile driving is assessed in this EFH. It is important to note that this assessment overstates the effects of project-specific construction elements, and is therefore conservative.

Pile driving can produce underwater sound pressure waves that can affect fish, with the type and intensity of sounds varying with factors such as the type and size of the pile, firmness of the substrate, depth of water, and the type and size of the pile driver. Larger piles and firmer substrate require greater energy to drive the pile resulting in higher sound pressure levels (SPL). Hollow steel piles appear to produce higher SPLs than similarly sized wood or concrete piles (Hastings and Popper 2005[3]). Sound attenuates more rapidly in shallow waters than in deep waters (Rogers and Cox 1988 in Hanson et al. 2003[4]). SPLs generated by the driving of hollow steel piles with impact hammers can reach levels that can injure fish (Hanson et al. 2003), and may not generate sound in the frequencies that elicits avoidance behavior in fish. Impact hammers generate short pulses of sound with little of the sound energy occurring in the infrasound frequencies, the sound frequencies that have been shown to elicit an avoidance

response in fish (Enger et al. 1993,[1] Knudsen et al. 1994, and Sand et al. 2000 in Hanson et al. 2003). Therefore, fish have been observed exhibiting an initial startle response to the first few strikes of an impact hammer, after which fish may remain in an area with potentially harmful sound levels (Dolat 1997,[2] NMFS 2001 in Hanson et al. 2003). While there is little data available on the SPL required to injure fish, fish with swim bladders and smaller fish have been shown to be more vulnerable (Hanson et al. 2003).

In-water construction is expected to last eight months for each bridge. Because the length of time for drilling each shaft is expected to be short and the tidal flux through the project area is high, individual fish would not be expected to be exposed to potentially dangerous SPLs long enough to result in mortality. Because the tidal flux through the project area is high, individual fish would not be expected to be exposed to potentially dangerous SPLs long enough to result in mortality. Furthermore, underwater sound radiated by pile driving will largely be confined and attenuated by the Hackensack River itself, significantly limiting potential impacts to regional fish populations. Lastly, in-water construction activities will not be conducted during the period identified as anadromous fish spawning period by regulatory authorities (typically April through June). Therefore, the pile driving that would occur as a result of the proposed project would not be expected to result in significant adverse impacts to aquatic biota.

The installation of piles would result in the direct loss of some benthic macroinvertebrates and benthic habitat associated with those organisms that are unable to move from the area of activity. The permanent loss of benthic macroinvertebrates within the piling footprints would not significantly impact the food supply for fish foraging in the area. Lastly, the new piles will provide additional attachment sites for algae and sessile invertebrates and some structures may provide suitable refuge to fish.

In summary, during construction of the in-water project elements for the project Alternatives, temporary increases in suspended sediment, noise generated by pile driving, and alterations to bottom habitat and benthic macroinvertebrates would not be expected to result in significant adverse impacts to aquatic biota of the Hackensack River.

OPERATION

The operation of the Portal Bridge(s) would not be expected to result in significant adverse impacts to water quality, and, therefore, would not be expected to result in significant adverse impacts to fish or benthic macroinvertebrates. The bridges would involve increasing the area of overwater coverage and the associated shading of aquatic habitat within the project site. It has been suggested that shading of estuarine habitats can result in decreased light levels which can lower productivity of primary producers and adversely affect invertebrates, and fish that use these areas particularly with respect to use as foraging habitat (Able et al. 1995,[3] Able et al. 2006[1]). The

amount of additional over-water shading for each alternative is discussed below. However, given the changing daily and seasonal angles of solar illumination, light would be expected to reach the water under these structures during portions of the day, reducing potential impacts to aquatic biota due to shading. Additionally, the generally high turbidities on the Hackensack River limit any effect of the additional shading to the first few feet of the water column – benthic communities would be relatively unaffected by the increase in shaded habitat. Lastly, because the tidal currents under the bridge(s) are strong and the bridge structure(s) are comparatively narrow, phytoplankton would be expected to move through the project site quickly and would not be expected to be adversely impacted by shading from the proposed project.

ASSESSMENT OF EFH SPECIES

An analysis of EFH for each fish species and life stage listed in Table 1—including the likelihood that the species would occupy the project area—is summarized below.

RED HAKE (UROPHYCIS CHUSS)

Red Hake is a bottom-dwelling fish that lives on sand and mud bottoms along the continental shelf from southern Nova Scotia to North Carolina (concentrated from the southwestern part of the Georges Banks to New Jersey). Spawning adults and eggs are common in marine portions of most coastal bays between Rhode Island and Massachusetts. Spawning occurs from May to June in the New York Bight (Steimle et al 1999a[2]). The Hackensack River is within an area designated as EFH for larval, juvenile, and adult red hake.

Larval red hake are free floating and occur in the middle and outer continental shelf. They are most common in water temperatures from 11 to 19°C (52-66°F) and depths from 10 to 200 m (33-660 ft). Recently metamorphosed juveniles remain pelagic (i.e. in the water column) for approximately two months, during which time they achieve growth up to 25-30 mm (1.0-1.2 in) in total length. Shelter/structure is a critical habitat requirement for juvenile red hake. In the autumn, juveniles descend from the water column to the bottom and seek sheltering habitat in depressions in the sea floor. Juvenile settlement usually occurs in October and November. Older juveniles use scallop shells, mussel beds, moon snail egg collars, and other available structure until their second autumn when they move inshore to waters less than 55 m (180 ft) in depth. They typically remain inshore until the temperature reaches 4°C (39°F), at which point they migrate offshore to overwinter (USACOE 2000,[3] Steimle et al. 1999a).

Woodhead (1990[4]) describes red hake as a common resident of the New York Harbor system. In the Harbor Estuary, the distribution of red hake is influenced by salinity, water temperature, and dissolved oxygen. Juvenile red hake were collected when salinity was greater than 22 ppt and at

depths from 5 to 50 m (16-164 ft) deep. Collections tapered off when salinity reached greater than 28 ppt. Adult red hake prefer temperatures from 2 to 22°C (36-72°F), salinity ranging from 20 to 33 ppt and depths greater than 25 m (82 ft) deep. In Middle Atlantic Bight, red hake occur most often in coastal waters in the spring and autumn, moving offshore to avoid warm summer temperatures. Additionally, red hake have been reported to be sensitive to dissolved oxygen levels and within the Harbor Estuary they preferred dissolved concentrations of 6 mg/L or more (Steimle et al. 1999a).

Juvenile and adult red hake have the potential to occur in the deeper waters in the vicinity of the Hackensack, but may be limited by occasional low DO concentrations and when salinity levels are low. The area of the proposed project represents a small portion of the EFH for this species. The southern stock of red hake (the stock that occurs within the Hackensack River) is not currently considered overfished (defined as the stock size being below a prescribed biomass threshold) (NMFS 2004,[1] 2005[2]). Water quality changes during construction of the proposed project would be minimal and temporary, limited to the immediate area of the activity. Water quality during operation of the proposed project would not be expected to change from the existing condition. Therefore, the proposed project would not result in significant adverse impacts to the EFH for this species.

WINTER FLOUNDER (PSEUDOPLEURONECTES AMERICANUS)

Winter flounder typically are found from Labrador to North Carolina, but are most common in estuaries from the Gulf of St. Lawrence to the Chesapeake Bay (Bigelow and Schroeder 1953,[3] Heimbuch et al. 1994,[4] USACOE 2000). This fairly small, thick flatfish is abundant in the Harbor Estuary, where it is a resident, but may move upriver into fresh water (Heimbuch et al. 1994). It spawns during the winter and early spring, typically at night in shallow, inshore estuarine waters with sandy bottoms. Woodhead (1990) reports spawning to occur mostly in the Lower New York Bay and the New York Bight. The Hackensack River is within an area designated as EFH for eggs, larval, juvenile, adult, and spawning adult winter flounder.

Winter flounder have negatively buoyant eggs that clump together and sink following fertilization (Heimbuch et al. 1994, USACOE 2000). Optimal egg hatching occurs at 3°C (37°F) and in salinity ranging from 15 to 25 ppt. Winter flounder larvae develop to juveniles within the estuarine systems. In March, April and May, winter flounder larvae can be found in the Upper New York Bay near the bottom (Heimbuch et al. 1994).

For the first summer, young-of-year winter flounder remain in the shallow waters (0.1-10 m [0.2-33 ft] in depth) of bays and estuaries where temperatures are generally less than 28°C (82°F) and salinities range from 5-33 ppt. Juveniles often occupy areas with sand and/or mud

substrates. Juveniles beyond their first year have also been found to overwinter in estuaries at temperatures less than 25°C (77°F), salinities from 10-30 ppt, and depths from 1-5 m (3-16 ft) (Pereira et al. 1999[1]). However, in some studies, wintertime juvenile catches generally increased outside of the estuary while at the same time decreasing within the estuary, suggesting that juveniles migrate out of the estuary in the winter (Pearcy 1962,[2] Warfel and Merriman 1944,[3] and Richards 1963 in Pereira et al. 1999).

Adult winter flounder prefer depths of 20 to 48 m (66-158 ft) and are commonly associated with mud, sand, pebble, or gravel bottoms (USACOE 2000). Adults generally leave the Harbor Estuary in the summer as water temperatures increase, returning in the autumn (Woodhead 1990). Winter flounder will live close to shore, swimming in shallow water to feed. Adults tend to move to deeper water when water temperatures increase in the summer or decrease in the autumn and winter (Heimbuch et al. 1994). NMFS Northeast Fisheries Science Center (NEFSC) trawls within the New York Harbor Estuary found adult winter flounder at temperatures between 4°C and 12°C (39-54°F) and salinities as low as 15 ppt, although most were found at salinities greater than 22 ppt. The bulk of the adult catch occurred in water depths of 25 m (82 ft) or less in the spring (during and just after spawning) and 25 m or deeper in the autumn (prior to spawning) (Pereira et al. 1999).

All stages of this demersal fish have the potential to occur within the project area. Juveniles feed on a variety of worms and small crustaceans, switching to mostly mollusks as they grow. Adults eat small invertebrates and fish. Because they are sight feeders, increased turbidity can interfere with feeding success (USACOE 2000). Within the Hackensack River, young-of-the-year may occur from early April through December. Yearling winter flounder may occur from late May to December. Catches of winter flounder in the Harbor Estuary off Manhattan have been reported to be highest from May through June (Woodhead 1990). Older winter flounder have been found in the Harbor Estuary from late May to September (Heimbuch et al. 1994).

While winter flounder are found throughout the Harbor Estuary, this species is currently experiencing high fishing rates that are in excess of natural production (annual exploitation rates from 55 to 70 percent). The Southern New England/Mid-Atlantic stock unit (which includes the New York population), is considered to be overfished. A rebuilding program is being implemented by the Secretary of Commerce (NMFS 2004, 2005). The 2001 exploitation rate was 37 percent (ASMFC 2002)[4], and the target exploitation rate for rebuilding winter flounder stocks in 10 years with a 50% probability is 24% (ASMFC 2005[5]). Water quality changes during construction of the proposed project would be minimal and temporary, limited to the immediate

area of the activity. Water quality during operation of the proposed project would not be expected to change from the existing condition. Therefore, the proposed project would not result in significant adverse impacts to the EFH for this species.

WINDOWPANE (SCOPTHALMUS AQUOSUS)

Windowpane, also called sand flounder, is found from the Gulf of St. Lawrence to South Carolina and maximally abundant in the New York Bight. Windowpanes are generally found offshore on sandy bottoms in water between 80 m deep (262 ft) and close inshore in estuaries just below the mean low water mark. They migrate inshore into shallow shoal waters in the summer and early autumn as water temperatures increase, and migrate offshore during the winter and early spring months when temperatures decrease. Windowpanes spawn within the mid-Atlantic Bight from April to December in bottom waters, with temperatures ranging from 8.5 to 13.5°C (47-56°F). Spawning peaks occur in May and then again in the autumn in the southern portion of the Bight (USACOE 2000). The Hackensack River is within an area designated as EFH for eggs, larval, juvenile, adult, and spawning adult windowpane.

The eggs and larvae are found predominately in the estuaries and coastal shelf water for the spring spawning period, and in the coastal shelf waters alone for those eggs spawned in the autumn. Windowpane eggs are buoyant, and can be found in the water column at temperatures of 5-20°C (41-68°F), specifically at 4-16°C (39-61°F) in spring (March through May), 10-16°C (50-61°F) in summer (June through August), and 14-20°C (57-68ºF) in autumn (September through November), and within depths less than 70 m (230 ft) (Chang et al. 1999[1]). Larvae are free swimming, and typically are found in the areas of the estuaries where salinity ranges from 18 to 30 ppt in the spring and on the continental shelf in the autumn. Juvenile windowpanes were found year-round in both the shelf waters and inshore during a recent study of the New York Harbor Estuary (Chang et al. 1999). In this study, juvenile fish were fairly evenly distributed but seemed to prefer the deeper channels in the winter and summer. They were most abundant where bottom water temperatures ranged from 5 to 23°C (41-73°F), depths ranged from 7 to 17 m (23-56 ft), salinities ranged from 22 to 30 ppt, and dissolved oxygen concentrations ranged from 7 to 11 mg/L. Similarly, adults were fairly evenly distributed year-round, preferring deeper channels in the summer months. Adults were collected in bottom waters where temperatures ranged from 0 to 23°C (32-73°F), depths were less then 25 m (82 ft), salinity ranged from 15 to 33 ppt, and dissolved oxygen ranged from 2 to 13 mg/L (USACOE 2000).

All life stages of windowpane have the potential to occur within the vicinity of the Hackensack River. The southern New England/Middle Atlantic windowpane stock is currently considered to be overfished. A stock rebuilding program is currently under review by the Secretary of Commerce (NMFS 2004, 2005). As with winter flounder, this species is widely distributed throughout the Harbor Estuary. Water quality changes during construction of the proposed project would be minimal and temporary, limited to the immediate area of the activity. Water quality during operation of the proposed project would not be expected to change from the existing condition. Therefore, the proposed project would not result in significant adverse impacts to the EFH for this species.

---

ATLANTIC HERRING (CLUPEA HARENGUS)

Atlantic herring is a planktivorous marine species that occurs throughout the Northwestern Atlantic waters from Greenland to North Carolina. They are most abundant north of Cape Cod and relatively scarce in waters south of New Jersey (USACOE 2000). Atlantic herring rarely move into fresh water (Smith 1985[1]). Juvenile and adult herring undergo complex north-south migrations and inshore-offshore migration for feeding, spawning, and overwintering. They spawn once a year in late August through November in the coastal ocean waters of the Gulf of Maine and Georges Banks. This species never spawns in brackish water. Post-spawn, the adults migrate to the New York Bight to overwinter from December to April. The autumn migration to overwintering areas is done in tight schools while the spring migration to spawning areas is much more dispersed. Fish that pass through the mid-Atlantic Bight are typically four years of age or older (USACOE 2000). The Hackensack is within an area designated as EFH for larval, juvenile, and adult Atlantic herring.

Larval herring are free-floating, and for autumn-spawned fish this stage can last 4 to 8 months. A fraction of those hatched remain at the spawning site, while others may drift in ocean currents, reaching eastern Long Island Sound. In the Gulf of Maine, larvae occur at temperatures ranging from 9 to 16°C (48-61°F), and a salinity of 32 ppt. During post-metamorphosis, which occurs through April and May, juveniles form large schools and move into shallow waters. Large schools of juveniles have been found in Connecticut and southern Massachusetts in May and June. In the summer and autumn, juveniles move out of the nearshore waters to overwinter in deep bays or near the bottom in offshore areas. Within Long Island Sound, springtime abundances have been reported as being highest at temperatures ranging from 9 to 10°C (48-50°F), depths ranging from 10 to 30 m (33-98 ft), and salinity ranging from 25 to 28 ppt. Within the New York Harbor Estuary, catches of herring were highest at temperatures ranging from 3 to 6°C (37-43°F) and in the deeper portions of the estuary (USACOE 2000). Juveniles in the NEFSC bottom trawl surveys of the New York Harbor Estuary were found to prefer temperatures at 2-16°C (36-61°F) and 12-22°C (54-72°F), and were most abundant at 4-6°C (40-43°F) and 15-18°C (59-64°F). Juveniles are commonly found at depths ranging from 30-135 m (98-443 ft) which varied seasonally (depths increasing with the summer months) (Reid et al. 1999).

On average, males and females mature at about 25-27 cm (10-11 in). In the NEFSC bottom trawl surveys, adults collected were most abundant at 3-6°C (37-43°F) at depths ranging from 4.5 to 13.5 m (14 to 44 ft). Preferred salinities for the Atlantic herring are greater than 28 ppt (Reid et al. 1999). Juveniles and adults perform diel and semi-diel vertical migrations in response to daily photoperiods and variations in turbidity. Being sensitive to light intensity, activity is highest after sunrise and just before sunset, when the herring will avoid the surface during daylight to avoid predators (Reid et al. 1999[2]).

Essential Fish Habitat Source Document: Atlantic Herring, *Clupea harengus* Life History and Habitat Characteristics. National Marine Fisheries Service. NOAA Technical Memorandum NMFS-NE 126, http://www.nefsc.nmfs.gov/nefsc/habitat/efh/ - list. 1999.

No spawning would occur within the Hackensack River, nor would larvae be likely to occur there. Juvenile and adult Atlantic herring could occur within the Hackensack River in low numbers because of salinity and depth preferences. The Atlantic herring stock complex in the northeastern United States is considered underutilized with the exception of the portion in the Gulf of Maine (Reid et al. 1999) and is not overfished (NMFS 2004, 2005). Further, because this species' stock is coastwide, the fraction of the population that may occur within the project area would be extremely small. Water quality changes during construction of the proposed project would be minimal and temporary, limited to the immediate area of the activity. Water quality during operation of the proposed project would not be expected to change from the existing condition. Therefore, the proposed project would not result in significant adverse impacts to the EFH for this species.

BLUEFISH (POMATOMUS SALTATRIX)

Bluefish is a carnivorous marine species that occurs in temperate and tropical waters on the continental shelf and in estuarine habitats around the world. In North America, bluefish live along most of the Atlantic coastal waters from Nova Scotia south, around the tip of Florida, and along the Gulf Coast to Mexico. Bluefish migrate between summering and wintering grounds, generally traveling in groups of fish of similar sizes and loosely aggregated with other groups. They generally migrate north in the spring and summer and south in the autumn and winter. Along the North Atlantic, summering waters are centered in the New York Bight, southern New England and northern sections of the North Carolina coastline. Wintering grounds are found in the southeastern parts of the Florida coast. Juvenile and adult bluefish travel far up estuarine waters (where salinity may be less then 10 ppt) while eggs and larvae are largely restricted to marine habitats (USACOE 2000). The Hackensack River is within an area designated as EFH for juvenile and adult bluefish.

There are two spawning stocks along the U.S. Atlantic coast—a south Atlantic spring spawn, and mid-Atlantic summer spawn. The fish spawning in the spring migrate to the Gulf Stream/coastal shelf interface between northern Florida and Cape Hatteras in April and May. Post-spring spawn, smaller bluefish drift westward while the larger fish slowly migrate north along the shelf and west into mid-Atlantic bays and estuaries including the New York Harbor Estuary where they remain until autumn. Summer-spawning fish migrate to the mid-Atlantic from Cape Cod to Cape Hatteras in June through August. Summer post-spawn fish head towards the mid-Atlantic shores and are particularly abundant in Long Island Sound (USACOE 2000, Fahay et al. 1999[1]). Juveniles from the spring spawn drift north in the early summer and enter the important nursery habitats in estuaries and bays along the mid-Atlantic coast in June. Summer-spawned fish enter the estuaries in mid- to late-summer (Buckel et al. 1999[2]). All spent fish and juveniles migrate to the wintering grounds in the autumn (USACOE 2000).

---

[1] Fahay, M.P., P.L. Berrien, D.L. Johnson, and W.W. Morse. Essential Fish Habitat Source Document: Bluefish, *Pomatomus saltatrix* Life History and Habitat Characteristics. National Marine Fisheries Service. NOAA Technical Memorandum NMFS-NE 144, http://www.nefsc.nmfs.gov/nefsc/habitat/efh/ - list. 1999.

[2] Buckel, J.A., D.O. Conover, N.D. Steinberg, and K.A. Mckown. Impact of age-0 bluefish (*Pomatomus saltatrix*) predation on age-0 fishes in the Hudson River estuary: evidence for density-dependent loss of juvenile striped bass (*Morone saxatilis*). *Canadian Journal of Fisheries and Aquatic Sciences* 56:275-287. 1999.

Juveniles in the Mid-Atlantic Bight inhabit inshore estuaries from May to October, preferring temperatures between 15 and 30°C (59-86°F), and salinities between 23 and 33 ppt. Although juvenile and adult bluefish are moderately euryhaline, they occasionally will ascend well into estuaries where salinities may be less than 3 ppt. Juveniles use estuaries as nursery areas, and can be found over sand, mud, silt, or clay substrates as well as in *Spartina* marshes or *Fucus* beds. Bluefish juveniles are sensitive to changes in temperature; thermal boundaries apparently serve as important cues to juvenile migration off shore in the winter season (Fahay et al. 1999).

Adult bluefish are pelagic and highly migratory with a seasonal occurrence in Mid-Atlantic estuaries from April to October. They prefer temperatures from 14-16°C (57-61°F) but can tolerate temperatures from 11.8-30.4°C (35-87°F) and salinities greater than 25 ppt. Adult bluefish are not uncommon in bays and larger estuaries, as well as in coastal waters (Bigelow and Schroeder 1953, Olla and Studholme 1971 in Fahay et al. 1999).

Within the Harbor Estuary, juvenile and adult bluefish may occur in the late spring through autumn. No spawning would occur within the project area. Historically, bluefish was categorized as overfished—the stock size was below the minimum threshold set for this species—and a rebuilding program has been implemented. However, recent estimates of fishing mortality suggest that the rebuilding program, state-by-state quota system, and recreational harvest limit have been successful and that overfishing is no longer occurring. (MAFMC 2002,[1] NMFS 2003, 2004, 2005). Water quality changes during construction of the Proposed Project would be minimal and temporary, limited to the immediate area of the activity. Water quality during operation of the proposed project would not be expected to change from the existing condition. Therefore, the proposed project would not result in significant adverse impacts to the EFH for this species.

ATLANTIC BUTTERFISH (PEPRILUS TRIACANTHUS)

Butterfish occur from Newfoundland to Florida and are most abundant between southern New England and Cape Hatteras. It has been suggested that two populations of butterfish exist. One population appears largely restricted to shoals (less than 20 m [66 ft]) south of Cape Hatteras, and another mainly north of Hatteras that occurs in shoals and possibly some deeper waters along of the shelf. Throughout its range, butterfish are found over the entire shelf, inshore and offshore. Cooling temperatures associated with late autumn trigger a migration offshore to the edges of the shelf where waters are warm. Butterfish require 10°C (50ºF) for survival. This species spawns from June to August in inshore waters generally less then 30 m (98 ft) deep. Peak egg production is in late June and early July off Long Island Sound. Studies performed in the Hudson-Raritan Estuary noted that butterfish comprised less than 1% of total catches of fish (USACOE 2000). The Hackensack River is within an area designated as EFH for larval, juvenile, and adult butterfish.

Newly hatched larvae are between 2 and 16 mm (0.1-0.6 in) in length. Larvae are found at the surface and often in the shelter of the tentacles of large jellyfish. The latter tend to be more nektonic (freely swimming) than planktonic (passively drifting with currents) when between 10 and 15 mm (0.4-0.6 in) long. Larvae are found at temperatures ranging from 7-26°C (45-79°F),

[1] Mid-Atlantic Fishery Management Council (MAFMC). Council Management, A Quiet Success Story. Council Newsletter, Summer 2002

although most abundant at 9-19°C (48-66°F), and at depths less than 120 m (394 ft) (Cross et al. 1999).

At 6 mm (0.24 in), larval body depth has increased substantially in proportion to length. At 15 mm (0.6 in), the fins are differentiated and the young fish takes on the general appearance of the adult. Adult butterfish can range from 120 to 305 mm (4.7-12 in) long. Both juveniles and adults have similar habitat characteristics. Both are eurythermal and euryhaline and are common often near the surface in sheltered bays and estuaries during the spring to autumn months. In the Hudson-Raritan trawl survey, juveniles and adults were found at depths from 3-23 m (10-75 ft), salinities from 19-32 ppt, and dissolved oxygen from 3-10 mg/L. Juvenile and adult butterfish also often prefer sandy and muddy substrates, and temperatures from 3-28°C (37-82°F) (Cross et al. 1999[1]).

Occasional adult and juvenile butterfish have the potential to occur within the project area. Spawning would not occur within the project area. Woodhead (1990) reports butterfish to be a common transient in the New York Harbor in the summer. Atlantic butterfish prefer sandy bottoms, but are not closely associated with the bottom when inshore during the summer. They may stay close to the bottom during the day and move into the water column at night (Smith 1985). Water quality changes during construction of the proposed project would be minimal and temporary, limited to the immediate area of the activity. Operation of the proposed project would not be expected to change from the existing condition. Therefore, the proposed project would not result in significant adverse impacts to the EFH for this species.

SUMMER FLOUNDER (PARALICTHYS DENTATUS)

Summer flounder prefer the estuarine and shelf waters of the Atlantic Ocean and are found between Nova Scotia and southeastern Florida. They are most abundant from Cape Cod, Massachusetts, to Cape Hatteras, North Carolina. Summer flounder usually appear in the inshore waters of the New York Bight in April, continuing inshore in May and June, and reach their peak abundance in July and August. Spawning takes place in the New York Bight in nearshore waters outside estuarine systems in September to October. Spawning occurs in surface water temperatures of 7-14°C (45-57°F), with peak activity occurring around 10-12°C (50-54°F) (Packer et al. 1999[2]). The Hackensack River is within an area designated as EFH for larval, juvenile, and adult summer flounder.

Larvae occur in water from 0 to 22°C (32-72°F) and are transported to estuarine nurseries by currents. Juvenile summer flounder are well adapted to the temperature and salinity ranges present in estuarine habitats. They are distributed throughout the estuary prior to late summer and are more concentrated in sea grass beds (as opposed to tidal marshes) in the late summer and early autumn (USACOE 2000). Planktonic larvae (2-13 mm [0.08-0.5 in]) have been found in temperatures ranging from 0-23°C (32-73°F), but are most abundant between 9°C and 17°C (48-

---

National Marine Fisheries Service. NOAA Technical Memorandum NMFS-NE 145, http://www.nefsc.nmfs.gov/nefsc/habitat/efh/ - list. 1999.

[2] Packer, D.B., S.J. Griesbach, P.L. Berrien, C.A. Zetlin, D.L. Johnson, and W.W. Morse. Essential Fish Habitat Source Document: Summer Flounder, *Paralichthys dentatus*, Life History and Habitat Characteristics. National Marine Fisheries Service. NOAA Technical Memorandum NMFS-NE 151, http://www.nefsc.nmfs.gov/nefsc/habitat/efh/ - list. 1999.

63°F). Salinity preference within the New Jersey area for this species was found between 20-30 ppt. In the Mid -Atlantic Bight, larvae were found at depths from 10-70 m (33-230 ft). Greater densities of young fish were found in or near inlets (Packer et al. 1999).

Young summer flounder move into shallow estuaries (i.e. 0.5-5.0 m [1.6-16 ft] in depth) using these areas as nursery habitat in the autumn, summer, and spring months. Juvenile summer are able to withstand a wider range of temperatures (greater than 11°C [52°F]) and salinities from 10-30 ppt than many species, and have evolved this tolerance to exploit estuarine nursery areas. Juveniles can be found on mud and sand substrates in flats, channels, salt marsh creeks, and eelgrass beds (Packer et al. 1999).

Adult summer flounder feed both in the shelf waters and estuaries and are more active in the daylight hours; they generally feed by sight (USACOE 2000). Adults are found to grow to lengths ranging from 25-71 cm (10-28 in). They inhabit sand substrates at depths up to 25 m (82 ft), at temperatures ranging from 9-26°C (48-79°F) in the autumn, 4-13°C (39-55°F) in the winter, 2-20°C (36-72°F) in the spring, and 9-27°C (48-81°F) in the summer. Salinity is known to have a minor effect on distribution as compared to substrate preference (Packer et al. 1999).

Spawning of summer flounder would not occur in the vicinity of the proposed project. Summer flounder have been collected in areas of the Upper Bay, primarily in the summer (USACOE 1999[1]). In 2002, the stock was considered overfished and was in the 8th year of a 10-year rebuilding program (NMFS 2003, MAFMC 2002). The latest stock assessment for summer flounder indicates that management measures have been successful. The resource is no longer overfished although overfishing is currently occurring (NMFS 2005). Summer flounder biomass is estimated to be above the threshold point for the first time since this species was placed under the joint management of the ASMFC and the MAFMC. The ASMFC and MAFMC have recommended increasing the total allowable landing limits to 28.2 million pounds in 2004 (compared to 23 million pounds in 2003) (ASMFC 2003). Water quality changes during construction of the proposed project would be minimal and temporary, limited to the immediate area of the activity. Water quality during operation of the proposed project would not be expected to change from the existing condition. Therefore, the proposed project would not result in significant adverse impacts to the EFH for this species.

BLACK SEA BASS (CENTROPRISTUS STRIATA)

Black sea bass is a marine species that occurs from Cape Cod, Massachusetts to Cape Canaveral, Florida. The fishery is divided into two populations: one major population north of Cape Hatteras, North Carolina, and one in southern waters. The northern population migrates seasonally: shoreward and north in the spring and offshore and south in the autumn. In the autumn, older fish move offshore sooner and overwinter in deeper waters (73 to 163 m [240-535 ft]) than young-of-the-year fish (56 to 110 m [184-361 ft]). Black sea bass can tolerate temperatures as low as 6°C (43°F) but are most abundant in off-shore waters warmer than 9°C (48°F) between 20 to 60 m (66-197 ft) deep (USACOE 2000). During the spring migration, adults move to spawning grounds and juveniles move into estuaries. For the northern population, spawning generally takes place in the summer, in water 18 to 45 m deep from the Chesapeake

[1] USACOE. New York and New Jersey Harbor Navigation Study. Draft Environmental Impact Statement. 1999.

Bay to Montauk Point, New York. The Hackensack River is within an area designated as EFH for juvenile and adult black sea bass.

Larvae develop for the most part in continental shelf waters and are most abundant in the southern portion of the Middle Atlantic Bight. Larvae quickly become bottom dwellers and move into estuaries. Those young-of-year fish in estuaries occupy bottom habitats with shells, amphipod tubes, and rubble, and have been observed on inshore jetties in late May to early June. In the Hudson River, young-of-the-year have been captured in both open water and interpier areas. Juvenile sea bass occur in the saline portions of estuaries from Massachusetts to Florida starting with the initial spring migration until late autumn and are commonly found around jetties, piers, wrecks, and bottom areas with shells (USACOE 2000). They appear to prefer hard bottom (Bigelow and Schroeder 1953).

Juveniles settle in estuaries and the inner continental shelf growing up to 19 cm (7.5 in). Young-of-the-year black sea bass inhabit estuarine areas in the Mid-Atlantic Bight at depths from 1-38 m (3-125 ft) from July to September. They prefer structured bottoms, shell patch substrates and often find shelter around manmade structures. Juveniles can be found in water temperatures ranging from 6-30°C (43-86°F) and salinities ranging from 8-38 ppt (but most preferring 18-20 ppt). The young-of-the-year are migratory during some portions of the first year. They migrate out of the estuaries and away from inner continental shelf nursery areas during the autumn as water temperatures drop (Steimle et al. 1999b). Adult black sea bass prefer similar habitat conditions as that of the juvenile and perform similar migratory patterns. Adults also tend to seek shelter around manmade structures (Steimle et al. 1999b[1]).

Black sea bass are bottom feeders, consuming crabs, shrimp, mollusks, small fish, and squid. Woodhead (1990) describes black sea bass as a common summer transient in the New York Harbor. Individuals have been collected in the New York Harbor and the Hackensack River (Smith 1985). Young-of-the-year have been collected in the lower Hudson River off Manhattan from mid-July to September (Able et al. 1995), and have the potential to occur within the project area. The USACOE collected low numbers of individuals in trawls conducted within the Port Jersey area from October 1998 through November 1999 (USACOE 1999).

While previously considered overfished, management efforts have been successful in rebuilding the stock and it is no longer considered overfished and overfishing is not occurring (ASMFC 2003, NMFS 2004, 2005). The ASMFC and MAFMC recently recommended increasing the total allowable landing limit for black sea bass from 6.8 million pounds in 2003 to 8.0 million pounds in 2004 (ASMFC 2003). Water quality changes during construction of the proposed project would be minimal and temporary, limited to the immediate area of the activity. Operation of the proposed project would not be expected to change from the existing condition. Therefore, the proposed project would not result in significant adverse impacts to the EFH for this species.

[1] Steimle, F.W., C.A. Zetlin, P.L. Berrien, and S. Chang. Essential Fish Habitat Source Document: Black Sea Bass, *Centropristis striata* Life History and Habitat Characteristics. National Marine Fisheries Service. NOAA Technical Memorandum NMFS-NE 143, http://www.nefsc.nmfs.gov/nefsc/habitat/efh/ - list. 1999b.

KING MACKEREL (SCOMBEROMORUS CAVALLA)

King mackerel is a marine species that inhabits Atlantic coastal waters from the Gulf of Maine to Rio de Janeiro, Brazil, including the Gulf of Mexico. There may be two distinct populations of king mackerel. One group migrates from waters near Cape Canaveral, Florida south to the Gulf of Mexico, making it there by spring and continuing along the western Florida continental shelf throughout the summer. A second group migrates to waters off the coast of the Carolinas in the summer, after spending the spring in the waters of southern Florida, and continues on in the autumn to the northern extent of the range. The Hackensack River is within an area designated as EFH for eggs, larval, juvenile, and adult king mackerel.

Overall, temperature appears to be the major factor governing the distribution of the species. The northern extent of its common range is near Block Island, Rhode Island, near the 20°C (68°F) isotherm and the 18-meter (59 ft) contour. King mackerel spawn in the northern Gulf of Mexico and southern Atlantic coast. Larvae have been collected from May to October, with a peak in September. In the south Atlantic, larvae have been collected at the surface with salinities ranging from 30 to 37 ppt and temperatures from 22 to 28°C (70-81°F). Adults are normally found in water with salinity ranging from 32 to 36 ppt (USACOE 2000).

King mackerel would likely occur only as rare transient individuals within the Hackensack River. The proposed project would not result in adverse impacts to the EFH for this species.

SPANISH MACKEREL (SCOMBEROMORUS MACULATUS)

Spanish mackerel is a marine species that can occur in the Atlantic Ocean from the Gulf of Maine to the Yucatan Peninsula. The Hackensack River is within an area designated as EFH for eggs, larval, juvenile, and adult Spanish mackerel. This species occurs most commonly between the Chesapeake Bay and the northern Gulf of Mexico from spring through autumn, and then over-winters in the waters of south Florida. Spanish mackerel spawn in the northern extent of their range (along the northern Gulf Coast and along the Atlantic Coast). Spawning begins in mid-June in the Chesapeake Bay and in late September off Long Island, New York. Temperature is an important factor in the timing of spawning and few spawn in temperatures below 26°C (79°F). Spanish mackerel apparently spawn at night. Studies indicate that Spanish mackerel spawn over the Inner Continental Shelf in water 12-34 m (39-112 ft) deep.

Spanish mackerel eggs are pelagic and about 1 mm in diameter. Hatching takes place after about 25 hours at a temperature of 26°C. Most larvae have been collected in coastal waters of the Gulf of Mexico and the east coast of the United States. Juvenile Spanish mackerel can use low salinity estuaries (~12.8 to 19.7 ppt) as nurseries and also tend to stay close inshore in open beach waters (USACOE 2000).

Overall, temperature and salinity are indicated as the major factors governing the distribution of this species. The northern extent of their common range is near Block Island, Rhode Island, near the 20°C (68°F) isotherm and the 18 meter contour. During warm years, they can be found as far north as Massachusetts. They prefer water from 21 to 27°C (70-81°F) and are rarely found in waters cooler than 18°C (64°F). Adult Spanish mackerel generally avoid freshwater or low salinity (less than 32 ppt) areas such as the mouths of rivers (USACOE 2000).

Because this is a marine species that prefers higher salinity waters, only occasional juvenile individuals are likely to occur within the Hackensack River. The resource is not overfished and

overfishing is not occurring (NMFS 2004, 2005). Therefore, the proposed project would not result in adverse impacts to the EFH for this species.

COBIA (RACHYCENTRON CANADUM)

Cobia are large, migratory, coastal pelagic fish of the monotypic family Rachycentridae. In the western Atlantic Ocean, cobia occur from Massachusetts to Argentina, but are most common along the south Atlantic coast of the United States and in the northern Gulf of Mexico. In the eastern Gulf, cobia migrate from wintering grounds off south Florida into northeastern Gulf waters during early spring. They occur off their northwest Florida, Alabama, Mississippi, and southeast Louisiana wintering grounds in the fall. Some cobia overwinter in the northern Gulf at depths of 100 to 125 m (328 to 410 feet). The Hackensack River is within an area designated as EFH for eggs, larval, juvenile and adult cobia.

Information on the life history of cobia from the Gulf and the Atlantic Coast of the United States is limited. Essential fish habitat for coastal migratory pelagic species such as cobia includes sandy shoals of capes and offshore bars, high profile rocky bottom and barrier island ocean-side waters, from the surf to the shelf break zone, but from the Gulf Stream shoreward, including areas inhabited by the brown alga *Sargassum.* For cobia, essential fish habitat also includes high salinity bays, estuaries, and seagrass habitat. The Gulf Stream is an essential fish habitat because it provides a mechanism to disperse coastal migratory pelagic larvae. Preferred temperatures are greater than 20°C and salinities are greater than 25 ppt.

Cobia are likely to occur only as rare transient individuals within the vicinity of the proposed project due to its coastal migrations, pelagic nature, and salinity requirements. The resource is not overfished and overfishing is not occurring (NMFS 2004, 2005). Therefore, the proposed project would not result in adverse impacts to the EFH for this species.

CLEARNOSE SKATE (RAJA EGLANTERIA)

The clearnose skate occurs along the Atlantic coast from the Nova Scotian Shelf to northeastern Florida and in the northern Gulf of Mexico from Texas to Florida. It is considered a southern species that is rare in the northern part of its range (Packer et al. 2003a). The Hackensack River is within an area designated as EFH for juvenile and adult clearnose skates. North of Cape Hatteras, clearnose skates move inshore and northward along the continental shelf during the spring and early summer and offshore and southward during autumn and early winter. This species occurs off of New Jersey and New York from late April to May and October to November (Packer et al. 2003a[1]).

In winter, juveniles are concentrated from the Delmarva Peninsula south to Cape Hatteras out to the 200 m contour. In spring they concentrate inshore from the Delaware Bay south to Cape Hatteras. In summer they occur inshore from the New Jersey coast to around Cape Hatteras with a limited presence off Cape Cod. In Hudson-Raritan Estuary bottom trawls, the largest numbers were found in the summer, particularly in and near channels and south of Coney Island. Small numbers were collected in the spring and autumn, with very few collected in the winter. The

[1] Packer, D.B., C.A. Zetlin, and J.J. Vitaliano. Essential Fish Habitat Source Document: Clearnose Skate, *Raja eglantaria*, Life History and Habitat Characteristics. National Marine Fisheries Service. NOAA Technical Memorandum NMFS-NE-174. 2003a.

distribution of adults in Hudson-Raritan Estuary trawls was similar to that of the juveniles (Packer et al. 2003a).

This skate is found on soft bottoms along the continental shelf but will also occur on rocky or gravelly bottoms. It is most abundant at depths less than 111 meters (364 ft). The Hudson-Raritan trawls found juveniles most abundant at depths of 5-7 m (16-23 ft) and temperatures between 13 and 24°C (55-75°F). Adults were most abundant at depths of 5-8 m (16-26 ft) and temperatures between 9 and 24°C (48-75°F). In this survey, clearnose skates were found at salinities ranging from 22 to 32 ppt (Packer et al. 2003a).

Clearnose skates may occur in the Hackensack River in spring and autumn, although the larger population of this southern species is concentrated around the Delmarva Peninsula and further south. The northeastern clearnose skate stock is not overfished and but it is not known if overfishing of this stock is currently occurring (NMFS 2005). Water quality changes during construction of the proposed project would be minimal and temporary, limited to the immediate area of the activity. Water quality during operation of the proposed project would not be expected to change from the existing condition. Therefore, the proposed project would not result in significant adverse impacts to the EFH for this species.

LITTLE SKATE (LEUCORAJA ERINACEA)

Little skates occur from Nova Scotia to Cape Hatteras and are possibly one of the most dominant demersal (bottom-dwelling) species in the northwest Atlantic. The center of abundance is in the northern portion of the Mid-Atlantic Bight and on George's Bank, where it is found year-round. Little skates do not undertake extensive migrations but do move onshore and offshore with the seasons—generally to shallow waters in the spring and deeper waters in winter (Packer et al. 2003b[1]). The Hackensack River is within an area designated as EFH for juvenile and adult little skates.

Little skates are generally found on sandy or gravelly bottoms but can also be found on muddy bottoms. This species is generally found in the Hudson-Raritan Estuary when temperatures are less than about 16-18°C (61-64°F). Juvenile little skates are generally absent from the Hudson-Raritan Estuary during summer months and well distributed throughout in the spring, autumn, and winter. Those that have been collected in the estuary in the summer during trawl surveys were generally found in the deeper, warmer waters of channels. Juveniles were generally found at depths between 4 and 24 m (13-79 ft) and salinities between 17 and 35 ppt (but most at ≥ 25 ppt).

Few adults were collected during the Hudson-Raritan Estuary surveys (conducted 1992-1997). Temperatures where this species was collected ranged from 1 to 17°C (34-63°F), depths from 5 to 16 m (16-52 ft), and salinities from 18 to 32 ppt (but most at ≥ 25 ppt). Only two adults were collected during the summer.

Based on NEFSC trawls, juvenile little skates have the potential to occur in the Hackensack River in the autumn through the spring while adults occur less commonly. Water quality changes during construction of the Proposed Project would be minimal and temporary, limited to the immediate area of the activity. Water quality during operation of the proposed project would not

[1] Packer, D.B., C.A. Zetlin, and J.J. Vitaliano. Essential Fish Habitat Source Document: Little Skate, *Leucoraja erinacea*, Life History and Habitat Characteristics. National Marine Fisheries Service. NOAA Technical Memorandum NMFS-NE-175. 2003b.

be expected to change from the existing condition. Therefore, the proposed project would not result in significant adverse impacts to the EFH for this species.

WINTER SKATE (LEUCORAJA OCCELATA)

The winter skate occurs from the south coast of Newfoundland and the southern Gulf of St. Lawrence to Cape Hatteras. Its center of abundance is on Georges Bank and in the northern portion of the Mid-Atlantic Bight. It is often second in abundance to the little skate (*Leucoraja erinacea*), and immature winter skates are often confused with immature little skates (Packer et al. 2003c[1]). The Hackensack River is within an area designated as EFH for juvenile and adult winter skates.

This skate is found most often on sandy or gravelly bottoms but can also be found on muddy bottoms. It is most abundant at depths less than 111 meters (364 ft). During surveys of the Hudson-Raritan Estuary, juvenile winter skates were generally absent during the summer and well distributed in winter, spring, and autumn. This species was most abundant in winter. Those individuals present in the summer were generally found in deeper channel waters. Juveniles are found in warmer waters during the spring and autumn (most at 6 to 9°C and 5 to 17°C, respectively) than winter (mostly in 0 to 7°C), and remain mostly around depths of 5 to 8 meters (16-26 feet) during those seasons. Salinities ranged from 15 to 34 ppt, but most were found between 23 and 32 ppt. Very few adults were collected in these surveys (conducted 1992-1997). Too few were found to determine their habitat preferences.

Juvenile and adult winter skates have the potential to occur within the vicinity of the Hackensack River. Water quality changes during construction of the proposed project would be minimal and temporary, limited to the immediate area of the activity. Water quality during operation of the proposed project would not be expected to change from the existing condition. Therefore, the proposed project would not result in significant adverse impacts to the EFH for this species.

E. POTENTIAL IMPACTS TO ENDANGERED SPECIES

SHORTNOSE STURGEON

The federally-listed and state-listed endangered shortnose sturgeon is an anadromous bottom-feeding fish that can be found throughout the greater Hudson River Estuary system. These fish spawn, develop, and overwinter in the mid-Hudson River well up-estuary of the project site (NYSDEC 2003[2]). Shortnose sturgeon spend most of their lives in the estuary and prefer colder, deeper waters for all lifestages. Individuals are only expected to in the vicinity of Portal Bridge as rare transient individuals while traveling to or from spawning, nursery and overwintering areas in the Hudson River Estuary.

Although larvae can be found in brackish areas of the Hudson River, juveniles (fish ranging from 2 to 8 years old) are predominately confined to freshwater reaches above the downstream saline area. The primary summer habitat for shortnose sturgeon in the middle section of the

---

[1] Packer, D.B., C.A. Zetlin, and J.J. Vitaliano. Essential Fish Habitat Source Document: Winter Skate, *Leucoraja ocellata*, Life History and Habitat Characteristics. National Marine Fisheries Service. NOAA Technical Memorandum NMFS-NE-179. 2003c.

[2] New York State Department of Environmental Conservation (DEC). NYSDEC, Endangered Species Unit, Shortnose Sturgeon Fact Sheet, NYSDEC Internet website, www.dec.state.ny.us/website/dfwmr/wildlife/endspec/shnostur.html 2003.

Hudson River (far from the Project area) is the deep river channel (13 to 42 meters deep, 43 to 138 feet). The river channel downstream of this middle estuary area is 18 to 48 meters deep (59 to 157 feet) (Peterson and Bain 2002). Shortnose sturgeon are not known to occur in the Hackensack River in recent times. Therefore, the proposed project would not result in significant adverse impacts to this species.

MARINE TURTLES

Four species of marine turtles, all state and federally listed, can occur in New York Harbor and its tributaries. Juvenile Kemps ridley (*Lepidochelys kempii*) and large loggerhead (*Caretta caretta*) turtles regularly enter the New York Harbor and bays in the summer and fall. The other two species, green sea turtle (*Chelonia mydas*) and leatherback sea turtle (*Dermochelys coriacea*), are usually restricted to the higher salinity areas of the Harbor. However, these four turtle species mostly inhabit Long Island Sound and Peconic and Southern Bays to the northeast, and Raritan and Barnegat Bays to the south. They neither nest in the New York Harbor Estuary, nor reside there year-round (Morreale and Standora 1995[1]). Turtles leaving Long Island Sound for the winter usually do so by heading east to the Atlantic Ocean before turning south (Standora et al. 1990[2]). These species are not known to occur in the Hackensack River. Therefore, the proposed project would not result in significant adverse impacts to this species. ✷

Ms. Christie Marcella
Portal Bridge Capacity Enhancement Project
c/o Howard/Stein-Hudson Associates, Inc.
517 West 35th Street, 7th Floor
New York, New York 10001

Dear Ms. Marcella:

The U.S. Fish and Wildlife Service (Service) has reviewed the Scoping Document for the proposed Portal Bridge Capacity Enhancement project located in Kearny and Secaucus, Hudson County, New Jersey.

AUTHORITY

This response is provided pursuant to the National Environmental Policy Act of 1969 as amended (83 Stat. 852; 42 U.S.C. 4321 *et seq.*) (NEPA), the Endangered Species Act of 1973 (87 Stat. 884, as amended; 16 U.S.C. 1531 *et seq.*) (ESA), the Migratory Bird Treaty Act of 1918 (40 Stat. 755, as amended; 16 U.S.C. 703-712), and consistent with the intent of the Service's Mitigation Policy (*Federal Register*, Vol. 46, No. 15, Jan. 23, 1981). These comments do not preclude separate review and comments by the Service pursuant to the Fish and Wildlife Coordination Act (48 Stat. 401, as amended; 16 U.S.C. 661 *et seq.*) or future review pursuant to NEPA.

BACKGROUND

The Federal Railroad Administration (FRA) (lead federal agency), Amtrak, and the New Jersey Transit Corporation propose to improve or replace the nearly 100-year-old Portal Bridge, which is a two-track, moveable swing-span rail bridge over the Hackensack River. On December 12, 2006, the FRA issued a Notice of Intent (NOI) to prepare an Environmental Impact Statement pursuant to NEPA. Alternatives under consideration include replacement, rehabilitation or modification of the existing bridge along with the construction of an additional bridge for added capacity. The general purpose of the project is to address mechanical, operational, maintenance, and capacity problems with the existing bridge. The Portal Bridge project is being coordinated with planning for the Access to the Region's Core (ARC) project, which involves a new passenger rail tunnel under the Hudson River and other new rail infrastructure.

The Portal Bridge Enhancement project may require State permits, a U.S. Coast Guard permit pursuant to Section 9 of the Rivers and Harbors Act of 1899 (30 Stat. 1151, as amended; 33 U.S.C. 403 *et seq.*), and a Department of the Army permit pursuant to Section 404 of the Clean Water Act (33 U.S.C. 1344 *et seq.*) and/or Section 10 of the Rivers and Harbors Act. The Service met with project proponents during the December 20, 2006 meeting of the Meadowlands Interagency Mitigation Advisory Committee (MIMAC), and attended a January 9, 2007 scoping meeting.

FEDERALLY LISTED SPECIES

Except for an occasional transient bald eagle (*Haliaeetus leucocephalus*), no other federally listed or proposed endangered or threatened flora or fauna under Service jurisdiction are known to occur within the vicinity of the proposed project site. Therefore, no further consultation pursuant to Section 7 of the ESA is required by the Service. If additional information on federally listed species becomes available, or if project plans change, this determination may be reconsidered.

MEADOWLANDS ECOSYSTEM

The Hackensack Meadowlands includes 8,400 acres of wetlands and uplands that support remarkable biodiversity. Species that use the Meadowlands include seventy-five percent of the 443 migratory bird species documented in New Jersey, 65 species of nesting birds, over 50 species of fish and shellfish, approximately 25 State-listed species, and 42 species considered rare or uncommon in the urban core. Over the last 150 years, industry and development have filled over half of the Meadowlands' original 21,000 wetland acres, and have polluted and fragmented its lands and waters. Congress has directed the Service to provide technical assistance for the restoration and protection of the Meadowlands (P.L. 109-54; see H.R. 109-80). The Service's New Jersey Field Office is fulfilling this directive through the *Hackensack Meadowlands Initiative: Preliminary Conservation Planning* and other work activities (fact sheets enclosed).

Wetlands and open waters adjacent to the subject rail bridge are targeted for restoration through the U.S. Army Corps of Engineers, New York District's (Corps) Hackensack Meadowlands Ecosystem Restoration Study (HMER). Candidate HMER restoration sites along the Portal Bridge approaches include Kearny Brackish Marsh, Laurel Hill Park Wetland, and Riverbend Wetland Preserve (U.S. Army Corps of Engineers, 2004). According to New Jersey's Landscape Project mapping, these wetlands provide foraging habitat for colonial-nesting waterbirds (Niles *et al.*, 2004). The New Jersey Meadowlands Commission (NJMC) is currently working with Hudson County and the New York-New Jersey Baykeeper on development of a restoration plan for Laurel Hill Park Wetland.

The northern approach to the Portal Bridge passes along the 67-acre, privately-owned Malanka Landfill. Operation of the landfill ceased in 1983, but the site was not formally closed in accordance with State standards (New Jersey Meadowlands Commission, 2004). A closure plan for the landfill was prepared in 1999 (U.S. Corps of Engineers, 2004). The southern approach and the bridge itself cross an area of land and water currently under investigation by the New

Jersey Department of Environmental Protection[1] for environmental contamination related to three known contaminated sites: Diamond Shamrock Corporation, Koppers Company Inc. Seaboard Plant, and Standard Chlorine Chemical Company Inc.

SERVICE RECOMMENDATIONS

The Service will provide ongoing input to the Portal Bridge project through the MIMAC and the NEPA process. We offer the following preliminary recommendations based on the NOI, the Scoping Document, and meetings attended to date.

- Contact the New Jersey Endangered and Nongame Species Program[2] (ENSP) to determine the recent history of nesting by the State-listed (endangered) peregrine falcon (*Falco peregrinus*) on bridges in the vicinity of the Portal Bridge. The ENSP may recommend Conservation Measures to protect peregrines during construction and/or provisions for post-construction bridge operation and management. Peregrines are known to nest on man-made structures within 1.5 miles of the Portal Bridge.

- Contact the New Jersey Natural Heritage Program[3] to determine any need to survey the project area for the presence or absence of the State-listed (endangered) plant wafer ash (*Ptelea trifoliate*), which is known to occur in the general vicinity.

- Avoid and minimize impacts to wetlands, especially candidate HMER restoration sites.

- Coordinate with the Hudson County Planning Department and the New York-New Jersey Baykeeper to ensure the Portal Bridge project does not jeopardize restoration of Laurel Hill Park Wetland.

- Construct any new or expanded rail infrastructure on elevated structures rather than fill embankments, when location of such facilities in wetlands is unavoidable.

- Remediate contamination in any new or expanded rights-of-way to the final clean-up standards specified by the U.S. Environmental Protection Agency and/or the New Jersey Department of Environmental Protection, since the presence of new rail infrastructure will preclude any additional remedial efforts following construction.

- Assess the potential release of environmental contaminants from temporary disturbances to wetlands and open waters. Use best management practices to contain contaminants during construction, and provide for post-construction remediation and long-term (3-10 years) contaminants monitoring of disturbed areas.

- Investigate options for compensatory mitigation at HMER candidate restoration sites. Any such plans would require early coordination with the Corps, the NJMC, and the MIMAC.

- Investigate combined mitigation with the ARC project.

Re: Threatened or Endangered Species Information Request
Portal Bridge Capacity Enhancement Project
Milepost 6.1 along Amtrak's Northeast Corridor
Between the City of Kearny and the City of Secaucus, Hudson County, New Jersey

Dear Mr. Jenkins:

The Federal Railroad Administration (FRA), in cooperation with the National Railroad Passenger Corporation (Amtrak) and the New Jersey Transit Corporation (NJ TRANSIT), are proposing to enhance the capacity and improve the operation of the Portal Bridge, a two-track rail crossing over the Hackensack River between the City of Kearny and the City of Secaucus, Hudson County, New Jersey. The Portal Bridge, which began operation in 1910, creates a bottleneck along Amtrak's Northeast Corridor and impedes efficient and reliable passenger rail service. An Environmental Impact Statement (EIS) is being prepared to analyze the potential environmental impact from the proposed project, including several project alternatives. The Portal Bridge Capacity Enhancement Project (the Project) will require coordination with the Federal Transit Administration (FTA), the U.S. Coast Guard (USCG), in addition to applicable natural resource and regulatory agencies including the U.S. Fish and Wildlife Service (USFWS), National Marine Fisheries Service (NMFS), U.S. Army Corps of Engineers (USACE), New Jersey Department of Environmental Protection's (NJDEP) Natural Heritage Program, and the NJDEP's Endangered and Nongame Species Program.

On January 9, 2007 AKRF, Inc. staff met with the USFWS and other agencies in Newark, NJ for a scoping meeting of the proposed project. The USFWS followed up with a letter dated February 2, 2007 reflecting on the Scoping Document and scoping meeting. The letter recommended that the New Jersey Endangered and Nongame Species Program (ENSP) be contacted specifically to determine the recent history of nesting by the State-listed (endangered) peregrine falcon (*Falco peregrinus*) on bridges in the vicinity of Portal Bridge.

On behalf of the FRA, Amtrak, and NJ Transit we would like to request information on peregrine falcons and any other federally listed threatened or endangered species, species of special concern, and habitats of special concern within the study area for the proposed project (see Figures 1 and 2). The information provided by the ENSP will be used for evaluation of potential environmental impacts associated with this proposed project. Map(s) showing specific locations of sensitive species or habitats developed lists provided by ENSP will not be published in any document. As part of this process, we also have requested similar information on rare species from the Natural Heritage Program, and other applicable natural resource agencies.

Please send the requested information to me at the address indicated above and feel free to call me at (856) 797-9930, extension 1624, if you should have any questions regarding this information request. Thank you for your time in providing us with this information.

Sincerely,

Michael Clayton
Environmental Scientist

Re: Threatened or Endangered Species Information Request
Portal Bridge Capacity Enhancement Project
Milepost 6.1 along Amtrak's Northeast Corridor
Between the City of Kearny and the City of Secaucus, Hudson County, New Jersey

Dear Ms. Rusanowsky:

The Federal Railroad Administration (FRA), in cooperation with the National Railroad Passenger Corporation (Amtrak) and the New Jersey Transit Corporation (NJ TRANSIT), are proposing to enhance the capacity and improve the operation of the Portal Bridge, a two-track rail crossing over the Hackensack River between the City of Kearny and the City of Secaucus, Hudson County, New Jersey. The Portal Bridge, which began operation in 1910, creates a bottleneck along Amtrak's Northeast Corridor and impedes efficient and reliable passenger rail service. An Environmental Impact Statement (EIS) is being prepared to analyze the potential environmental impact from the proposed project, including several project alternatives. The Portal Bridge Capacity Enhancement Project (the Project) will require coordination with the Federal Transit Administration (FTA), the U.S. Coast Guard (USCG), in addition to applicable natural resource and regulatory agencies including the U.S. Fish and Wildlife Service (USFWS), National Marine Fisheries Service (NMFS), U.S. Army Corps of Engineers (USACE), New Jersey Department of Environmental Protection's (NJDEP) Natural Heritage Program, and the NJDEP's Endangered and Nongame Species Program.

On behalf of the FRA, Amtrak, and NJ Transit, we would like to request information on Essential Fish Habitat (EFH) and Fish and Wildlife Coordination Act species under the jurisdiction of NMFS within the vicinity of the study area for the proposed project (see Figures 1 and 2). The information provided by NMFS will be used for evaluation of potential environmental impacts associated with this proposed project. Map(s) showing specific locations of sensitive species or habitats developed from lists provided by NMFS will not be published in any document.

Please send the requested information to me at the address indicated above and feel free to call me at (856) 797-9930, extension 1624, if you should have any questions regarding this information request. Thank you for your time in providing us with this information.

Sincerely,

Michael Clayton
Environmental Scientist

Re: New Jersey Transit Portal Bridge Replacement (20214)

Dear Mr. Clayton:

Thank you for your data request regarding rare species information for the above referenced project site in Kearny Town and Secaucus Town, Hudson County.

Searches of the Natural Heritage Database and the Landscape Project (Version 2) are based on a representation of the boundaries of your project site in our Geographic Information System (GIS). We make every effort to accurately transfer your project bounds from the topographic map(s) submitted with the Request for Data into our Geographic Information System. We do not typically verify that your project bounds are accurate, or check them against other sources.

We have checked the Natural Heritage Database and the Landscape Project habitat mapping for occurrences of any rare wildlife species or wildlife habitat on the referenced site. Please see Table 1 for species list and conservation status.

Table 1 (on referenced site).

Common Name	Scientific Name	Federal Status	State Status	Grank	Srank
colonial waterbird foraging habitat					

We have also checked the Natural Heritage Database and the Landscape Project habitat mapping for occurrences of any rare wildlife species or wildlife habitat within one half mile of the referenced site. Please see Table 2 for species list and conservation status. This table excludes any species listed in Table 1.

Table 2 (additional species within one half mile of referenced site).

Common Name	Scientific Name	Federal Status	State Status	Grank	Srank
American coot	*Fulica americana*		D	G5	S1B
coastal heron rookery				GU	S3
peregrine falcon	*Falco peregrinus*		E	G4	S1B,S?N
pied-billed grebe	*Podilymbus podiceps*		E/S	G5	S1B,S3N

We have also checked the Natural Heritage Database for occurrences of rare plant species or ecological communities. The Natural Heritage Database has a record for an occurrence of *Ptelea trifoliata* that may be on the site. The attached list provides more information about this occurrence. **Because some species are sensitive to disturbance or sought by collectors, this information is provided to you on the condition that no specific locational data are released to the general public. This is not intended to preclude your submission of this information to regulatory agencies from which you are seeking permits.**

Also attached is a list of rare species and ecological communities that have been documented from Hudson County. If suitable habitat is present at the project site, these species have potential to be present.

Status and rank codes used in the tables and lists are defined in the attached EXPLANATION OF CODES USED IN NATURAL HERITAGE REPORTS.

If you have questions concerning the wildlife records or wildlife species mentioned in this response, we recommend that you visit the interactive I-Map-NJ website at the following URL, http://www.state.nj.us/dep/gis/depsplash.htm or contact the Division of Fish and Wildlife, Endangered and Nongame Species Program at (609) 292 9400.

PLEASE SEE THE ATTACHED 'CAUTIONS AND RESTRICTIONS ON NHP DATA'.

Thank you for consulting the Natural Heritage Program. The attached invoice details the payment due for processing this data request. Feel free to contact us again regarding any future data requests.

Sincerely,

Herbert A. Lord

SUBJECT: Federal Transit Administration/NJ Transit/Amtrak
Portal Bridge Capacity Enhancement Project
Kearny and Secaucus, Hudson Co., NJ

Karen Greene
(Reviewing Biologist)

We have reviewed the information provided to us regarding the above subject project. We offer the following preliminary comments pursuant to the Endangered Species Act, the Fish and Wildlife Coordination Act and the Magnuson-Stevens Fishery Conservation and Management Act **for all project segments.**

Endangered and Threatened Species

No threatened or endangered species under NMFS' jurisdiction are expected to occur in project area.

Fish and Wildlife Coordination Act

The waters of the Hackensack River provide habitat for a wide variety of species of concern to NMFS including, anadromous and resident fish, forage and benthic species such as American shad, alewife, blueback herring, striped bass, winter flounder, bluefish, bay anchovy, white perch, weakfish, summer flounder, American eel and spot.

DEPENDING UPON THE PROJECT DETAILS POSSIBLE RECOMMENDATIONS INCLUDE:

Impacts to wetlands and other aquatic habitats should be minimized to the maximum extent practicable. Seasonal restrictions on in-water work may be recommended depending upon the project details. The typical seasonal work restriction to protect anadromous fish migration is no in water work from April 1 to June 30 of any year. Compensatory mitigation should be provided for all unavoidable impacts to wetlands and other waters of the US.

Magnuson-Stevens Fishery Conservation and Management Act
Essential Fish Habitat

The estuarine waters of the Hackensack River have been designated as Essential Fish Habitat (EFH) for one or more species. Further EFH consultation by the lead federal action agency will be necessary as part of the federal permit process. For a listing of EFH and further information, please go to our website at: http://www.nero.noaa.gov/hcd. If you wish to discuss this further, please call 732-872-3023.

May 5, 2008

Mr. John Wilkins, Director of Capital Plans and Programs
NJ TRANSIT
One Penn Plaza East
Newark, NJ 07105-2246

Dear Mr. Wilkins,

In March of 2005, MCT acquired a 587 acre tract of land formerly known as the Empire Tract, now renamed the Richard P. Kane Natural Area. The deed to the property stipulates that of the 587 acres, a maximum of 352 acres are available to use for wetland mitigation credits and the remaining 235 acres can be restored/enhanced but not used for credits. The deed further states that wetland mitigation credits shall only be used for the 4 New Jersey transportation entities' use on wetland impacting projects within the Meadowlands District.

The crucial purpose of the Kane Tract wetlands mitigation bank and restoration project is to provide effective off-site compensatory mitigation for past and future environmental impacts on wetland resources associated with the New Jersey public transportation entities within the Meadowlands District. Currently, NJ TRANSIT and Port Authority NY/NJ are actively requesting and pursuing land on the Kane Tract to fulfill their wetland mitigation credit needs. The Trust is providing the opportunity to NJ transportation entities and their projects to come to fruition through their use of wetland mitigation credits on the Kane Tract.

Meadowlands Conservation Trust has put out a Request for Proposals (RFP) for the restoration and creation of a wetlands mitigation bank project on the Kane Tract.
The Trust is embarking on this project with the intent of having the environment as the highest concern while remaining fiscally solvent. MCT will be the landlord of the property with the awarded wetlands mitigation bank firm as the lessee. Significant environmental gains are anticipated from this restoration given the size of the property and the relative lack of significant contiguous wetland habitats in the Meadowlands region that support native vegetation.

There are several key stakeholders in the Kane Tract project. Senator Frank Lautenberg, Congressman Steve Rothman and NJ Senator Paul A. Sarlo are three government officials with a strong interest in seeing this environmentally oriented project completed. Some other governmental agencies involved include, NJDEP, U.S. Army Corps., NJ Transit, NY/NJ Port Authority, State of NJ Department of Transportation and NJ Turnpike Authority NJ Meadowlands Commission, County of Bergen and Bergen County Utilities Authority. The following non-profits and educational institutions are also interested in working with the aforementioned stakeholders on this joint venture: NY/NJ Baykeeper, Hackensack Riverkeeper, Inc., Ramapo University and Rutgers University.

Please be assured that the Meadowlands Conservation Trust is actively working with NJ TRANSIT through Mr. Thomas Schulz by providing effective off-site compensatory mitigation for future environmental impacts on wetland resources associated with NJ TRANSIT's ARC and Portal Bridge projects. By working together, the restoration of the Kane Tract will become a win-win situation for both the environment and for the pubic through improved transportation services within the Meadowlands region.

Regards,

Kristina R. Schvejda

Re: Portal Bridge - Milepost 6.1 – Amtrak Northeast Corridor

Dear Mr. Clayton,

This is in response to your letter requesting information on the presence of species listed by NOAA's National Marine Fisheries Service (NMFS) in the vicinity of the Portal Bridge, a two-track rail crossing over the Hackensack River between the City of Kearny and the City of Seacaucus, New Jersey. An Environmental Impact Statement (EIS) is being prepared by Amtrak and the Federal Railroad Administration.

While several species of listed whales and sea turtles are known to be seasonally present in the waters of New Jersey, no species listed by NMFS occur in the Hackensack River. As such, no further coordination on the impacts of the proposed project on species listed by NMFS is necessary. Should project plans change, new information become available that changes the basis for this determination, or new species be listed, further coordination should be pursued. If you have any questions regarding these comments, please contact Julie Crocker at (978)281-9328 x6530.

Sincerely,

for Mary A. Colligan

Coastal Zone Management Agency Correspondence

May 15, 2008

Mark Mauriello, Assistant Commissioner
NJDEP Division of Land Use Regulation
501 E. State Street P.O. Box 439
Trenton, NJ 08625-0439

Re: **Portal Bridge Capacity Enhancement Project**
Coastal Zone Consistency Determination

Dear Mr. Mauriello:

The National Railroad Passenger Corporation (Amtrak) and the New Jersey Transit Corporation (NJ TRANSIT) are proposing to enhance the capacity and improve the operation of the Portal Bridge, a rail crossing over the Hackensack River in Hudson County, New Jersey. A Draft Environmental Impact Statement (EIS) was issued by the Federal Railroad Administration (FRA), the lead federal agency, in February 2008. The Federal Transit Administration (FTA), U.S. Environmental Protection Agency (USEPA), and the U.S. Coast Guard (USCG) are cooperating agencies for the environmental review. A copy of the Draft EIS was submitted to your office.

As the Final EIS is now being prepared, NJ TRANSIT and FRA are seeking your office's concurrence with the Coastal Zone Consistency Determination. To facilitate NJDEP's concurrence with this determination, the attached statement of compliance documents the applicability and/or planned method of compliance for the Coastal Zone Management policies set forth in N.J.A.C. 7-7E. The existing bridge is located within the Meadowlands District and is adjacent to tidal wetlands. While it was determined during the alternatives development process that complete avoidance of wetlands impacts was not feasible, the conceptual design seeks to minimize wetlands impacts through the use of structure (as opposed to embankment) for the approaches to the two new bridges. To mitigate unavoidable wetlands impacts, the project sponsors are coordinating with the Meadowlands Conservation Trust and the appropriate agencies regarding the Richard P. Kane Natural Area Wetland Mitigation Bank. The purpose of this bank, which is currently being established in accordance with the Request for Qualifications issued by the Meadowlands Conservation Trust on April 7, 2008, is to provide compensatory mitigation for New Jersey's transportation entities including NJ TRANSIT.

It is our understanding that NJDEP has 60 days to concur or object to this determination. If you have any questions about the project or would like to set up a meeting, please contact Christie Marcella at 917-339-0488.

Sincerely,

John Wilkins
NJ TRANSIT

Attachment 1 – Agency Correspondence

A. INTRODUCTION

The National Railroad Passenger Corporation (Amtrak) and the New Jersey Transit Corporation (NJ TRANSIT) have proposed to enhance the capacity and improve the operation of the Portal Bridge, a rail crossing over the Hackensack River in Hudson County, New Jersey. The Federal Railroad Administration (FRA) and NJ TRANSIT issued a Draft Environmental Impact Statement (DEIS) in February 2008, and are preparing the Final Environmental Impact Statement (FEIS) to analyze the potential environmental impacts from the proposed project. FRA is the lead federal agency for the EIS efforts. The Federal Transit Administration (FTA), U.S. Environmental Protection Agency (USEPA), and the U.S. Coast Guard (USCG) are cooperating agencies for the environmental review. The EIS documents and supporting information are available for public review on the internet at http://www.portalbridgenec.com/. The study area for the project extends east to west from Secaucus Transfer Station (also known as the "Frank R. Lautenberg Station" or "Secaucus Junction") to Kearny Junction Interlocking and north to south 2,000 feet from the Northeast Corridor (Figure 1).

The existing Portal Bridge is a two-track, moveable swing-span bridge that was constructed by the Pennsylvania Railroad (PRR) and began operation in 1910. The aging Portal Bridge, owned by Amtrak but traversed by other operators such as NJ TRANSIT, is a bottleneck along the Northeast Corridor that conflicts with marine traffic and impedes efficient and reliable passenger rail service (Figures 2 and 3). The Northeast Corridor is the most heavily used passenger rail line in the U.S., both in terms of ridership and service frequency. The Northeast Corridor extends from Washington, D.C. in the south to Boston, MA in the north, serving the densely populated northeast region, including Pennsylvania Station in New York City. Amtrak, the nationwide inter-city passenger rail operator, owns much of the region's railroad infrastructure and operates over all of the Northeast Corridor. Amtrak carries approximately 15,700 passengers each day in each direction over the Portal Bridge, including 3,900 passengers per day on the time-sensitive premium Acela Express service. NJ TRANSIT carries an average of 150,000 passengers per day in both directions over the Portal Bridge on almost 350 trains (not including non-revenue trains that are not available to the public for transportation).

The Portal Bridge Capacity Enhancement Project originally evaluated a series of conceptual alternatives in a comprehensive Alternatives Screening Report[1]. This report conducted a fatal flaw analysis of 30 alternatives, and evaluated criteria such as constructability, capacity enhancement, engineering feasibility, cost and reliability, and environmental impacts, among others. Based on these factors, the Alternatives Screening Report recommended two conceptual alternatives: (1) construction of a two-track moveable bridge on the southern alignment and construction of a three-track fixed bridge on the northern alignment; and (2) construction of a two-track moveable bridge on the existing Portal Bridge alignment and construction of a three-track fixed bridge on the northern alignment.

The DEIS examines four alternatives in addition to the "no build" scenario. The four build alternatives include variations of the two conceptual alternatives recommended in the Alternatives Screening Report. The four build alternatives are illustrated in Figures 4 through 12. The four build alternatives differ primarily in two respects: the location of the southern bridge and the type of grade-separated crossing provided for one track (Track 5). For purposes of nomenclature, the four build alternatives are as follows:

- **Alternative DS.** This alternative includes a three-track fixed northern bridge, a two-track moveable southern bridge built on a new southern alignment, and a duck-under structure for Track 5;
- **Alternative DE.** This alternative includes a three-track fixed northern bridge, a two-track moveable southern bridge built on the existing alignment, and a duck-under structure for Track 5;

[1] Available on the project's website:

http://www.portalbridgenec.com/pdfs/Portal%20Bridge%20Alternatives%20Screening%20Report.pdf

- **Alternative FE.** This alternative includes a three-track fixed northern bridge, a two-track moveable southern bridge built on the existing alignment, and a fly-over structure for Track 5;
- **Alternative FS.** This alternative includes a three-track fixed northern bridge, a two-track moveable southern bridge built on a new southern alignment, and a fly-over structure for Track 5.

The alternatives using a new southern alignment (Alternatives DS and FS) would result in slightly more wetland impacts than their counterparts (Alternatives DE and FE, respectively), but would also have a shorter construction period. All four alternatives were thoroughly evaluated in the DEIS. The FEIS is being prepared to address public and agency comments received at the public hearing and during the comment period (which closed on March 31, 2008). The FEIS will also recommend a preferred alternative based on a variety of factors, including constructability, cost, duration of construction impacts, and environmental impacts. The preferred alternative will not be finalized until FRA issues a Record of Decision (ROD). After a ROD is issued, the project sponsors will proceed to the preliminary design phase of the project. NJ TRANSIT and Amtrak have preliminarily recommended Alternative DS as the preferred alternative, although this cannot be confirmed until after FRA considers this recommendation and the ROD is issued. FRA requires a Coastal Zone Consistency Determination from the New Jersey Department of Environmental Protection (NJDEP) prior to finalizing the FEIS. Therefore, NJ TRANSIT and Amtrak are seeking a Coastal Zone Consistency Determination from NJDEP at this time. To facilitate this determination, the following statement of compliance documents the applicability and/or planned method or methods of compliance for the Coastal Zone Management policies set forth at N.J.A.C. 7-7E (as amended on April 7, 2008) . This Coastal Zone Consistency compliance assessment considers all four build alternatives described above.

B. REGULATORY CONTEXT

COASTAL ZONE MANAGEMENT ACT PROGRAM POLICIES IN NEW JERSEY

The federal Coastal Zone Management Act (CZMA) of 1972 was established to encourage coastal states to manage development within the states' designated coastal areas, reduce conflicts between coastal developments, and protect resources within the coastal zone. Requirements for federal approval of coastal zone management programs and grant application procedures for development of the state programs is included in 15 C.F.R. Part 923, Coastal Zone Management Program Development and Approval Regulations, National Oceanic and Atmospheric Administration (NOAA). The Coastal Zone Management Act requires that federal activities within a state's coastal zone be consistent with that state's coastal zone management plan. New Jersey has a federally approved coastal zone management program, which is administered by NJDEP.

NJDEP regulates coastal zone activities under N.J.A.C. Section 7:7E, Coastal Zone Management (CZM) Policies. Section 7:7E sets forth substantive rules of the NJDEP regarding the use and development of coastal resources, to be used primarily by the Department's Land Use Regulation Program in reviewing permit applications under the Coastal Area Facility Review Act (CAFRA), N.J.S.A. 13:9A-1 et seq (as amended to July 19, 1993), Wetlands Act of 1970, N.J.S.A. 13:9A-1 et seq, Waterfront Development Law, N.J.S.A. 12:5-3, Water Quality Certification (401 of the Federal Clean Water Act), and Federal Consistency Determinations (307 of the Federal Coastal Zone Management Act). Because the Portal Bridge Capacity Enhancement Project is outside the CAFRA Zone, consistency with CAFRA is not addressed in this assessment.

N.J.A.C. 7:7E-1.2 defines coastal waters as any tidal waters of the State and all lands lying there under. Coastal waters of the State of New Jersey extend from the mean-high-water (MHW) line out to the three geographical mile limit of the New Jersey territorial sea, and elsewhere to the interstate boundaries of the States of New York, Delaware, and the Commonwealth of Pennsylvania. The definition includes all lands outside of the coastal area as defined by CAFRA, extending from the MHW line of a tidal water body to

the first paved public road, railroad, or surveyable property line (existing on September 26, 1980) generally parallel to the waterway, provided that the landward boundary of the upland area shall be no less than 100 feet and no more than 500 feet from the MHW line. The definition also includes all areas containing tidal wetlands and the Hackensack Meadowlands District as defined by N.J.S.A. 13:17-4.

The Portal Bridge Capacity Enhancement Project is within the coastal zone, because the project is within the Hackensack Meadowlands District. As such, consistency with applicable Coastal Zone Management Policies must be determined.

C. NEW JERSEY DEPARTMENT OF ENVIRONMENTAL PROTECTION COASTAL ZONE MANAGEMENT POLICIES

This section presents the NJDEP CZM Policies as described in New Jersey Administration Code (N.J.A.C. Section 7:7E) and describes the "build" alternatives' consistency with those policies. Administrative or defining policies have not been included in this assessment; however, policies within the regulation that have marked by NJDEP as "Reserved" have been retained herein as placeholders to facilitate a comprehensive review of these regulations.

At the time of this writing (May 2008), detailed engineering designs for the Portal Bridge Capacity Enhancement Project are not available. As mentioned above, the preliminary engineering phase of the project is expected to begin mid-2008, after FRA issues a ROD for a preferred alternative. Regardless, the project is incorporating measures at the earliest stages to ensure compliance with applicable State and Federal laws, regulations, policies, and guidance, as appropriate, including the provisions of N.J.A.C. 7:7E. In instances for which unavoidable environmental impacts are involved due to the nature and location of the proposed project, mitigative or restorative measures are planned and will be implemented, in accordance with applicable regulations, to offset such impacts, even if the precise details of such are unknown at this time.

LOCATION RULES – SPECIAL AREAS

7:7E-3.2: SHELLFISH HABITAT

Shellfish habitat is defined as an estuarine bay or river bottom which has a history of production for hard clams (Mercenaria mercenaria), soft clams (Mya arenaria), eastern oysters (Crassostrea virginica), bay scallops (Argopecten irradians), or blue mussels (Mytilus edulis). Development which would result in the destruction, condemnation (downgrading of the shellfish growing water classification) or contamination of shellfish habitat, as defined by the rule, is prohibited.

A survey of benthic macrofauna of Newark Bay in 1993 and 1994 used benthic grab sampling to assess the composition and abundance of benthic organisms (Stehlik et al, 2005).[2] This survey collected data from a station located in the mouth of the Hackensack River several miles downstream of the project area in saltier bay waters. Common organisms (either by abundance or by mass) included the soft-shell clam (*Mya arenaria*), the blue mussel (*Mytilus edulis*), the tunicate *Mogula manhattensis*, the polychaete worms *Streblospio benedicti* and *Tharyx* spp., and the estuarine bivalve *Macoma balthica*, among others. Annelid and oligochaete worms were also abundant in samples, as were various crustaceans (e.g., isopods). Another survey of benthic invertebrates closer to the project area in the Riverbend Wetlands

[2] Stehlik, L.L., S.J. Wilk, R.A. Pikanowski, D.G. McMillan, and E.M. MacHaffie. "Benthic Macrofauna and Associated Hydrographic Observations Collected in Newark Bay, New Jersey between June 1993 and March 1994." Northeast Fisheries Science Center Reference Document 05-07. 2005.

Preserve yielded *Macoma balthica*, the burrowing anemone *Edwardsia elegans*, several polychaete, isopod, and amphipod species, and the snail *Spurwinka salsa* (ENSR 2004), but no species classified as shellfish at N.J.A.C. 7:7-3.2.[3]

Inferences about the types of benthic invertebrates present in an area can also be made by examining the diets of fish that prey upon them. For example, Neuman et al. (2004)[4] examined the food habits of white perch, striped bass, and bluefish in the Hackensack Meadowlands from marshes approximately five miles upriver of the project area. These investigators documented a very similar mix of species in the stomach contents of these fish, as well as blue crab (*Callinectes sapidus*), grass shrimp (*Palaemonetes pugio*), Mysid shrimp (mainly *Neomysis americana*), *Gammarus* amphipods, Chironomid larvae, and mud snails (*Ilyanassa obsoleta*), among others. While the relative abundances of these invertebrates is unknown due to differences in feeding habits between fish species and many other variables, this list is indicative of the kinds of species that may be present in the project area.

This policy is not applicable to the Portal Bridge Capacity Enhancement Project because the project area is not in a shellfish area as delineated by the NJDEP shellfish classification areas as available on the NJDEP I-map online environmental mapping utility:

http://njgin.state.nj.us/dep/DEP_iMapNJDEP/viewer.htm

Furthermore, species present, as described in the studies cited above, are not generally classified as shellfish at N.J.A.C. 7:7-3.2 (although *Mya arenaria* and *Mytilus edulis* occur in Newark Bay downstream of the project, these species are not found in the project area),

7:7E-3.3: SURF CLAM AREAS

Surf clam areas are coastal waters which can be demonstrated to support significant commercially harvestable quantities of surf clams (Spisula solidissima), or areas important for recruitment of surf clam stocks. This includes areas where fishing is prohibited for research sanctuary or conservation purposes by N.J.A.C. 7:25-12.1(d)4. Surf clams are a marine fish and therefore are also subject to the marine fish and fisheries rule, N.J.A.C. 7:7E-8.2. Development which would result in the destruction, condemnation, or contamination of surf clam areas is prohibited except under specific conditions defined by the rule.

This policy is not applicable to the Portal Bridge Capacity Enhancement Project because oceanic surf clams (*Spisula solidissima*) are not present in the Hackensack River. Surf clams inhabit ocean waters beyond the surf zone, and do not occur in brackish estuaries or rivers.

7:7E-3.4: PRIME FISHING AREAS

Prime fishing areas include tidal water areas and water's edge areas which have a demonstrable history of supporting a significant local intensity of recreational or commercial fishing activity. These areas include all coastal jetties, groins, public fishing piers or docks, and artificial reefs. Prime fishing areas also include features such as rock outcroppings, sand ridges or lumps, rough bottoms, aggregates such as cobblestones, coral, shell and tubeworms, slough areas and offshore canyons. Prime fishing areas also include areas identified in "New Jersey's Recreational and Commercial Fishing Grounds of Raritan Bay,

---

[3] ENSR International. Screening Level Ecological Risk Assessment of Contamination for Restoration I Hackensack Meadowlands District Final Report. New Jersey Meadowlands Commission, Meadowlands Research Institute. 2004.

[4] Neuman, M.J., G. Ruess, and W. Able. "Species Compositions and Food Habits of Dominant Fish Predators in Slat Marshes of an Urbanized Estuary, the Hackensack Meadowlands, New Jersey." *Urban Habitats*, Vol. 2, No. 1. pp. 62-82. 2004.

Sandy Hook Bay and Delaware Bay and The Shellfish Resources of Raritan Bay and Sandy Hook Bay" Figley and McCloy (1988) and those areas identified on the map titled, "New Jersey's Specific Sport Ocean Fishing Grounds."

Use of prime fishing areas, as defined and identified by the rule, is prohibited. This includes sand or gravel submarine mining, which would alter existing bathymetry to a significant degree so as to reduce the high fishery productivity of these areas. Disposal of domestic or industrial wastes must meet applicable State and Federal effluent limitations and water quality standards.

This rule is not applicable, because no elements of the Portal Bridge Capacity Enhancement Project fall within the delineated prime fishing areas, as defined by the referenced documents and maps.

7:7E-3.5: FINFISH MIGRATORY PATHWAYS

Finfish migratory pathways are waterways (rivers, streams, creeks, bays and inlets) which can be determined to serve as passageways for diadromous fish to or from seasonal spawning areas, including juvenile anadromous fish which migrate in autumn and those listed by H.E. Zich (1977) "New Jersey Anadromous Fish Inventory" NJDEP Miscellaneous Report No. 41, and including those portions of the Hudson and Delaware Rivers within the coastal zone boundary. Species of concern include: alewife or river herring (Alosa pseudoharengus), blueback herring (Alosa sapidissima), American shad (Alosa sapidissima), striped bass (Morone saxatilis), Atlantic sturgeon (Acipenser oxyrhynchus), Shortnose sturgeon (Acipenser brevirostrum) and American eel (Anguilla rostrata).

Development that obstructs fish passageways, lowers water quality to an extent that interferes with fish movement, or violates standards is prohibited in waterways that serve as migratory pathways unless mitigation is provided.

Anadromous species that may use the Hackensack River include striped bass, tomcod, and members of the herring family. Striped bass use the Hackensack River and other waterways in the New York Bight for migration from fall through spring. Mature striped bass return from marine waters to fresh water to spawn before migrating back to salt water. The young then use the brackish waters as nursery and wintering area. Juvenile striped bass migrate to marine waters when nearing maturity. The majority of adults then spend much of their time in coastal, bay, and river mouth waters before returning to spawn in the spring each year (Bigelow and Schroeder 1953).[5] Juvenile striped bass eat a variety of invertebrates; adults eat a variety of fish and may also eat shrimp. Young-of-the-year and older striped bass have been shown to overwinter in large numbers in the lower Hudson River estuary. They feed primarily on invertebrates; as they grow, striped bass feed primarily on fish (Fay et al. 1983).[6]

Tomcod is an inshore species of cod that is distributed from southern Labrador to Virginia along the Atlantic Coast. Adults may spawn in marine waters but are typically anadromous and migrate into rivers and estuaries during late fall and winter to spawn. In New York Harbor Estuary waters, the adult tomcod move out from shore to cooler waters in the spring. These fish feed mainly on small crustaceans (Bigelow and Schroeder 1953).

U.S. Army Corps of Engineers (USACOE), TR EL-82-4. 1983.

Two of the common anadromous species are members of the herring family—alewife and American shad. These species live in the ocean as adults and move into estuaries in spring on their spawning migrations. Both spawn in freshwater. Juveniles migrate from the estuaries in their first year primarily in the fall. These species primarily eat small planktonic crustaceans and other invertebrates (Bigelow and Schroeder 1953).

The single catadromous species common to the Hackensack River is the American eel. Eels spawn in the Atlantic Ocean and the young move into the estuary as elvers in the spring, typically in February and March (Fahay 1978,[7] Sullivan et al. 2006).[8] American eels are opportunistic feeders and juveniles eat crustaceans, polychaetes, bivalves and fish. They grow slowly and at sexual maturity move down the estuary in the fall and out to sea (Bigelow and Schroeder 1953).

POTENTIAL PERMANENT IMPACTS

In-water structures can serve as barriers to fish migration, especially when these structures create significant areas of turbulence, cause a rapid change in hydraulic head, or physically restrict passage to a large degree (USACOE 1991).[9] Typically, these types of obstructions (or restrictions) are found in flowing rivers blocked by hydroelectric dams, low-head weirs, or culverts. In the case of the build alternative, the width of the navigable channel would be increased from two 99-foot-wide passages to a single 300-foot-wide passage, with substantial additional open water areas between piers. This increase is due to the removal of the central pier and dolphins that house the existing bridge's swing mechanism in the center of river. These wide passages are not expected to hamper fish movements due to the effects of the structures in the water.

Anthropogenic noise in the estuarine environment can have an impact on aquatic organisms under certain conditions. Lethal and sub-lethal effects can be caused by sound levels of sufficient energy to cause soft-tissue damage, and behavioral effects can be caused by underwater sounds on those species evolved to detect them (Hastings and Popper 2005).[10] In many cases, such as those involving pile driving, dredging, offshore wind farms, and vessel operation, the effects of these sounds are beginning to be understood (Vella et al 2001).[11] The sound radiated by bridges is less well-understood. A number of factors drive the sound intensity and frequency range radiated into the aquatic environment, including but not limited to bridge design and construction approach, materials, degree of coupling to the water column, typical uses, and water depth (Hazelwood 1994).[12]

Although the degree and effect of radiated noise from the existing Portal Bridge on the ecology of the Hackensack River is largely unknown, this noise must be considered in a regional context. Many other sources of natural and anthropogenic sounds exist in the New York Harbor Estuary, one of the largest

commercial ports in the Western Hemisphere. Fish moving through the estuary will encounter an acoustic environment that is far noisier than any that which occurs in the region of the Portal Bridge. The sound levels in the estuary result from the presence of shipping associated with numerous deep draft shipping terminals. While noise levels from shipping in the estuary are not available, it is possible to get a first approximation based upon sound levels from other locations. A recent study in Hong Kong harbor demonstrated that there was a generally high noise level in the area (Würsig and Green 2002).[13] The highest sound levels recorded in that study (approximately 110 to 150 dB) were associated with ship propellers. The sound from a single vessel is above hearing thresholds of fishes approximating those in the estuary and would potentially be detectable to a fish within 50 or 100 meters of the propeller. Due to the substantial noise (from ships as well as other sources) already present in the Harbor Estuary, the radiated noise from the operation of Portal Bridge is expected to be comparatively small. Furthermore, discounting potential differences in bridge design, the build alternatives are not expected to radiate substantially more sound into the water than the existing bridge.

POTENTIAL CONSTRUCTION IMPACTS

The project site spans the Hackensack River, and would be strongly influenced by tidal currents. While measures such as silt curtains would be employed during in-water work, it is possible that some sediment may escape such controls. Any temporary sediment resuspension associated with pile driving or other construction activities would be localized to the project site. This sediment would be expected to dissipate shortly after the completion of the sediment disturbing activity and would not be expected to result in impacts to water quality or aquatic biota. Sediments throughout the Harbor Estuary contain contaminants and therefore work in the river would require special consideration and planning in advance of construction. While Hackensack River sediments have been found to contain contaminants at concentrations that may pose a risk to some benthic macroinvertebrates, the tidal currents within the project area should dissipate these sediments such that redeposition within or outside the project area would not be expected to adversely affect benthic macroinvertebrates or bottom fish. Furthermore, sediment resuspension will be mitigated through the use of silt curtains or other appropriate technologies during the period of disturbance.

Life stages of estuarine-dependent and anadromous fish species are generally tolerant of elevated suspended sediment concentrations and have evolved behavioral and physiological mechanisms for dealing with variable concentrations of suspended sediment (Birtwell et al. 1987, Dunford 1975, Levy and Northcote 1982 and Gregory 1990 in Nightingale and Simenstad 2001, LaSalle et al. 1991).[14, 15, 16, 17] Fish are mobile and generally avoid unsuitable conditions such as increased suspended sediment and

noise (Clarke and Wilber 2000).[18] While a localized increase in suspended sediment may cause fish to temporarily avoid the area where bottom disturbing activities are occurring, the affected area would be expected to be small. Similar nearby suitable habitats would be available for use by fish to avoid the area being disturbed. Many estuarine fish species also have the ability to expel materials that may clog their gills when they return to cleaner, less sediment-laden waters. Therefore, temporary increases in suspended sediment resulting from in-water construction activities would not be expected to result in significant adverse impacts to fish.

While it is expected that the project would not use driven piles for the bridge pier foundations, the effects of pile driving on fish were used as a worst-case analysis for any in-water construction activities. Pile driving can produce underwater sound pressure waves that can affect fish, with the type and intensity of sounds varying with factors such as the type and size of the pile, firmness of the substrate, depth of water, and the type and size of the pile driver. Larger piles and firmer substrate require greater energy to drive the pile resulting in higher sound pressure levels (SPL). Hollow steel piles appear to produce higher SPLs than similarly sized wood or concrete piles (Hastings and Popper 2005).[19] Sound attenuates more rapidly in shallow waters than in deep waters (Rogers and Cox 1988 in Hanson et al. 2003).[20] SPLs generated by the driving of hollow steel piles with impact hammers can reach levels that can injure fish (Hanson et al. 2003), and may not generate sound in the frequencies that elicits avoidance behavior in fish. Impact hammers generate short pulses of sound with little of the sound energy occurring in the infrasound frequencies, the sound frequencies that have been shown to elicit an avoidance response in fish (Enger et al. 1993, Knudsen et al. 1994, and Sand et al. 2000 in Hanson et al. 2003). Therefore, fish have been observed exhibiting an initial startle response to the first few strikes of an impact hammer, after which fish may remain in an area with potentially harmful sound levels (Dolat 1997, NMFS 2001 in Hanson et al. 2003).[21] While little data are available on the SPLs required to injure fish, fish with swim bladders and smaller fish have been shown to be more vulnerable (Hanson et al. 2003).

In-water construction is expected to last twelve months for each bridge. Because the length of time for drilling each shaft is expected to be intermittent and the tidal flux through the project area is high, individual fish would not be expected to be exposed to potentially dangerous SPLs long enough to result in mortality. Furthermore, underwater sound radiated by drilling would largely be confined and attenuated by the Hackensack River itself, significantly limiting potential impacts to regional fish populations. Lastly, the project would work in consultation with the NJDEP to adjust construction methods and schedule to reduce impacts to migratory fish species based on their seasonal presence in the project area. Therefore, the in-water work that would occur as a result of the proposed project would not be expected to result in significant adverse impacts to aquatic biota.

SUMMARY

Construction of in-water elements of the Portal Bridge Capacity Enhancement Project has the potential to temporarily affect certain diadromous fish species that may use the Hackensack River as a conduit to spawning grounds. These species include the anadromous American shad (*Alosa sapidissima*), blueback

herring (*Alosa aestivalis*), alewife (*Alosa pseudoharengus*), striped bass (*Morone americana*), and the catadromous American eel (*Anguilla rostrata*). Potential construction impacts include resuspension of sediments and anthropogenic noise associated with construction activities. The project would work in consultation with the NJDEP to adjust construction methods and schedule to reduce impacts to migratory fish species based on their seasonal presence in the project area. For example, herring migration is closely linked to water temperature. In this example, temperatures in excess of those at which anadromous species migrate and/or spawn may allow for some flexibility in the permitted construction methods and schedule. No operational effects of the bridge are expected, because in-water elements of the build alternatives would not obstruct fish passage.

7:7E-3.6: SUBMERGED VEGETATION HABITAT

A Submerged vegetation special area consists of water areas supporting or documented as previously supporting rooted, submerged vascular plants such as widgeon grass (Ruppia maritima), sago pondweed (Potamogeton pectinatus), horned pondweed (Zannichellia palustris) and eelgrass (Zostera marina). In New Jersey, submerged vegetation is most prevalent in the shallow portions of the Navesink, Shrewsbury, Manasquan and Metedeconk Rivers, and in Barnegat, Manahawkin and Little Egg Harbor Bays. Other submerged vegetation species in lesser quantities include, but are not limited to, the following: water weed (Elodea nuttalli), Eriocaulon parkeri, Liaeopsis chinesis, Naja flexilis, Nuphar variegatum, Potamogeton crispus, Potamogeton epihydrus, Potamogeton perfoliatus, Potamogeton pusillus, Scirpus subterminalis and Vallisneria americana. Detailed maps of the distribution of the above species for New Jersey, and a method for delineation, are available from DEP in the New Jersey Submerged Aquatic Vegetation Distribution Atlas (Final Report), February, 1980, conducted by Earth Satellite Corporation and also on "Eelgrass Inventory" maps prepared by the Division of Fish and Wildlife, Bureau of Shellfisheries, 1983. If the Department is presented with clear and convincing evidence that a part of its mapped habitat lacks the physical characteristics necessary for supporting or continuing to support the documented submerged vegetation species, such a site would be excluded from the habitat definition.

Development in submerged vegetation habitat, as defined by the rule, is prohibited except for specific exceptions provided by the rule.

Submerged aquatic vegetation (SAV) consists of vascular aquatic plants that are often found in shallow areas of estuaries. These organisms are important because they provide nursery and refuge habitat for fish. Benthic algae are often large multicellular algae that serve as important primary producers in the aquatic environment. They are usually observed attached to rocks, jetties, pilings, and sandy or muddy bottoms (Hurley 1990).[22] Since these organisms require sunlight as their primary source of energy, the limited light penetration of the Hackensack River limits their distribution to shallow or intertidal areas. Light penetration, turbidity, and nutrient concentrations are all important factors in determining SAV and benthic algae productivity and biomass.

None of the studies reviewed as part of this assessment reported the presence of SAV in the Hackensack River, likely owing to high turbidities and attendant limited light penetration. Common macro-algae known to occur in Newark Bay include the Phaeophyte species *Fucus vesiculosus* as well as the Chlorophyte species *Ulva lactuca*. These species have a particular affinity for hard substrates within the photic zone, and are frequent colonists of pilings, rocks, bulkheads, and other structures. Freshwater input from the Hackensack and Passaic Rivers probably limits the occurrence of these species in the project

[22] Hurley, L.M. *Field Guide to the Submerged Aquatic Vegetation of Chesapeake Bay.* U.S. Fish and Wildlife Service, Chesapeake Bay Estuary Program, Annapolis, MD. 1990.

area. The green alga genus *Enteromorpha* spp. probably occurs in the project area, especially as an epiphyte on emergent marsh grasses (Perlmutter 1971).[23]

This rule is not applicable, because no elements of the Portal Bridge Capacity Enhancement Project fall within submerged aquatic vegetation (SAV) habitat. The Hackensack River at the project location is an area of high turbidity and current velocities that are not supportive of SAV.

7:7E-3.7: NAVIGATION CHANNELS

Navigation channels are tidal water areas including the Atlantic Ocean, inlets, bays, rivers and tidal guts with sufficient depth to provide safe navigation. Navigation channels include all areas between the top of the channel slopes on either side. These navigation channels are often marked with buoys or stakes. Major navigation channels are shown on NOAA/National Ocean Service Charts.

The navigability of existing navigation channels must not be impacted by dredging or development, or by siltation as a result of said dredging or development.

Construction of in-water elements of the Portal Bridge Capacity Enhancement Project has the potential to temporarily impact the Hackensack River navigational channel. Impacts could include the temporary mooring of construction barges in the channel to deploy project components. Any limited, temporary closures required during construction would be closely coordinated with USCG and follow acceptable protocol. Impacts from sediment resuspension are expected to be minor, with no impacts to the navigational channel. Operational impacts of the project to navigation are not anticipated, because the build alternatives are being designed to accommodate present and anticipated navigational needs and would include the widening the horizontal clearance of the channel.

7:7E-3.8: CANALS

Canals are navigation channels for boat traffic through land areas that are created by cutting and dredging or other human construction technique sometimes enlarging existing natural surface water channels. The Cape May, Point Pleasant, and Delaware and Raritan Canals are the principal examples in the New Jersey Coastal zone.

No elements of the Portal Bridge Capacity Enhancement Project fall within man-made canals. Therefore, this rule is not applicable.

7:7E-3.9: INLETS

Inlets are natural channels through barrier islands allowing movement of fresh and salt water between the ocean and the back bay system. Inlets naturally have delta fans of sediment seaward and landward, deposited by the ebb and flow of the tide.

No elements of the Portal Bridge Capacity Enhancement Project fall within areas defined as inlets. Therefore, this rule is not applicable.

7:7E-3.10: MARINA MOORINGS

Marina moorings are areas of water that provide mooring, docking and boat maneuvering room as well as access to land and navigational channels for five or more recreational boats. Non-water dependent development in a marina mooring area is prohibited. Any use that would detract from existing or proposed recreational boating use in marina mooring areas is discouraged.

---

[23] Perlmutter, A. "Ecological Studies Related to the Proposed Increase in Generating Capacity at the Astoria Power Station of Consolidated Edison." Report prepared for the Consolidated Edison Company of New York, Inc. 1971.

No elements of the Portal Bridge Capacity Enhancement Project fall within a marina or marina mooring area. Therefore, this rule is not applicable.

7:7E-3.11: PORTS

Ports are water areas having, or lying immediately adjacent to, concentrations of shoreside marine terminals and transfer facilities for the movement of waterborne cargo (including fluids), and including facilities for loading, unloading and temporary storage. Port locations in New Jersey include, among others, Newark, Elizabeth, Bayonne, Jersey City, Weehawken, Hoboken, Woodbridge, Perth Amboy, Camden, Gloucester City, Paulsboro and Salem.

No elements of the Portal Bridge Capacity Enhancement Project affect port operations. Therefore, this rule is not applicable.

7:7E-3.12: SUBMERGED INFRASTRUCTURE ROUTES

A "submerged infrastructure route" is the corridor in which a pipe or cable runs on or below a submerged land surface. Any activity that will increase the likelihood of damage to a submerged pipe or cable, or interfere with maintenance operations, is prohibited.

There is an existing underwater cable that is used to power the existing moveable bridge. With all four build alternatives, the existing cable would be severed at each end and abandoned in place beneath the riverbed.

7:7E-3.13: SHIPWRECKS AND ARTIFICIAL REEFS

The shipwreck and artificial reef habitats special area includes all permanently submerged or abandoned remains of vessels, and other structures including but not limited to, artificial reefs, anchors, quarry rocks or lost cargo, which serve as a special marine habitat or are fragile historic and cultural resources. An artificial reef is a manmade imitation of a natural reef created by placing hard structures on the sea floor for the purpose of enhancing fish habitat and fish stock. In time, an artificial reef will attain many of the biological and ecological attributes of a natural reef. Artificial reefs do not include shore protection structures, pipelines and other structures not constructed for the sole purpose of fish habitat.

There are no artificial reefs or shipwrecks serving as submerged habitat exist within the Portal Bridge Capacity Enhancement Project area. Therefore, this rule is not applicable.

7:7E-3.14: WET BORROW PITS

Wet borrow pits are scattered artificially created lakes that are the results of surface mining for coastal minerals extending below groundwater level to create a permanently flooded depression. This includes, but is not limited to, flooded sand, gravel and clay pits, and stone quarries. Where a wet borrow pit is also a wetland and/or wetlands buffer, the Wetlands rule, N.J.A.C. 7:7E-3.27, and/or Wetlands Buffers rule, N.J.A.C. 7:7E-3.28, shall apply.

There are no wet borrow pits within the Portal Bridge Capacity Enhancement Project area. Therefore, this rule is not applicable.

7:7E-3.15: INTERTIDAL AND SUBTIDAL SHALLOWS

Intertidal and subtidal shallows mean all permanently or temporarily submerged areas from the spring high water line to a depth of four feet below mean low water. Development, filling, and new dredging are generally discouraged in intertidal and subtidal shallows, but may be permitted in accordance with the Use Policy for the applicable water body type (in this case, large rivers). Submerged infrastructure is conditionally acceptable, provided that there is no feasible alternative route that will not disturb intertidal and subtidal shallows, the infrastructure is buried deeply enough to avoid exposure or hazard, and all trenches are backfilled with naturally occurring sediment.

POTENTIAL PERMANENT IMPACTS

The two new Hackensack River bridges and several of the structures needed to traverse existing roads and rail rights-of-way would require the installation of caissons and/or piles in wetland and open water areas, along with embankments and retaining walls. Structural components of the Portal Bridge Capacity Enhancement Project (e.g. piles, caissons) were specifically designed to avoid placement in intertidal and subtidal shallows of the Hackensack River and as defined by the rule; however, in some cases impacts to these areas is unavoidable. In particular, support piles in the Kearny Brackish Marsh ("West Approach Span") and the West Lagoon affect intertidal or shallow subtidal habitat. Detailed bathymetry of these impounded open waters is not available, so the extent to which the impact areas comprise intertidal, shallow subtidal, and deeper habitats cannot be assessed at present. For the purposes of this assessment, the entire area affected by these piles is presented as a conservative (i.e., high) estimate of intertidal and subtidal shallows impacts. Specific areas of impacts to subtidal and intertidal shallows will be refined as design engineering proceeds; the mitigation for impacts to these areas will be included in a detailed mitigation plan for the project.

The following discussion addresses impacts associated with direct losses of benthic habitat in general (although not exclusively subtidal or intertidal shallows) and shading of these habitats (including subtidal shallows and intertidal flats). These impacts are summarized in Table 1.

The area of direct loss of benthic habitat would be relatively small compared to the availability of such habitat in adjacent waters. Within the areas of benthic habitat permanently occupied by support structures, impacts to sessile and infaunal benthic invertebrates would be expected. The direct loss of these organisms would have a highly localized effect, and would not be expected to result in significant adverse impacts to fish and other aquatic organisms for several reasons. First, the area of impact to benthic habitat (described below) would be orders of magnitude less than the areas of adjacent equivalent habitat. Second, estuarine benthic invertebrates typically have evolved short times to maturity, high fecundities, and widely dispersed juvenile stages in response to the variable nature of their environment (Brey 2001).[24] The estuarine environment is highly dynamic, and shifts in habitat type can occur rapidly (Brey 2001). On a population level, estuarine benthic invertebrates are well-adapted to responding to localized stresses or even losses of individuals. Lastly, the bridge support caissons and/or piles would increase habitat complexity in the area, providing attachment surface for the estuarine fouling community (including barnacles, mussels, hydroids, algae, tunicates, etc.) and would essentially serve as an artificial reef habitat. This increased complexity can serve as an additional ecological niche within the project area, offering novel opportunities for foraging that would partially mitigate for the loss of benthic habitat. In addition, the removal of the existing Portal Bridge and associated piers, piles, and fenders would be removed to or below the mudline, thereby creating new benthic habitat that would be rapidly colonized by benthic invertebrates. The recoverable benthic habitat associated with this removal ranges from a minimum of 0.04 acres of bottom (assuming that only timber piles penetrate the substrate) to 0.57 acres (assuming that the existing mudline extends up into the area covered by pier structure).

The proposed new bridges would increase the area of overwater coverage and the associated shading of aquatic habitat within the project site. It has been suggested that shading of estuarine habitats can result in decreased light levels, which can lower productivity of primary producers and adversely affect invertebrates, and fish that use these areas particularly with respect to use as foraging habitat (Able et al. 1995, Able et al. 2006).[25, 26] The amount of additional overwater shading for each build alternative is discussed in detail

---

[24] Brey T (2001) Population dynamics in benthic invertebrates: a virtual handbook. Version 01.2. http://www.awibremerhaven.de/Benthic/Ecosystem/FoodWeb/Handbook/main.html. Alfred Wegener Institute for Polar and Marine Research, Bremerhaven

below. However, given the changing daily and seasonal angles of solar illumination, light would be expected to reach the water under these structures during substantial portions of the day, reducing potential impacts to aquatic biota due to shading. Additionally, the generally high turbidities on the Hackensack River limit any effect of the additional shading to the first few feet of the water column—benthic communities would be relatively unaffected by the increase in shaded habitat. Thirdly, because the tidal currents under the bridge(s) are strong and the bridge structure(s) would be comparatively narrow, plankton would be expected to move through the project site quickly and would not be expected to be adversely impacted by shading from the proposed project. Lastly, as described above, the piers, piles, and fender projections associated with the existing bridge rests would be removed to or below the mudline, thereby creating benthic habitat that will be rapidly colonized by benthic invertebrates.

* Piers in Intertidal/Subtidal Shallows are a subset of "Piers in Open Water". Total Permananet

** Benthic Habitat Loss is a subset of the area covered by "Piers in Open Water", because piles driven into the substrate are joined above the bottom to form a pier

*** Vegetated wetlands include Phragmites-dominated coastal wetlands

POTENTIAL CONSTRUCTION IMPACTS

In-water project elements necessary to support the build alternatives, such as bridge demolition and caissons drilling, have the potential to result in temporary adverse impacts to subtidal shallows due to increases in suspended sediment. As discussed under N.J.A.C. 7:7E-3.5 above, the project site spans the Hackensack River, and would be strongly influenced by tidal currents. While measures such as silt curtains would be employed during in-water work, it is possible that some sediment may escape such controls. Any temporary sediment resuspension associated with pile driving or other construction activities would be localized to the project site. This sediment would be expected to dissipate shortly after the completion of the sediment disturbing activity and would not be expected to result in impacts to water quality or aquatic biota. Life stages of estuarine-dependent and anadromous fish species, bivalves and other macroinvertebrates generally are generally tolerant of elevated suspended sediment concentrations and have evolved behavioral and physiological mechanisms for dealing with variable concentrations of suspended sediment. The invertebrate species found in the Hackensack River are necessarily adapted to naturally turbid estuarine conditions and can tolerate short-term exposures by closing valves or reducing pumping activity. Mobile benthic invertebrates that occur in estuaries have been found to be tolerant of extremely elevated suspended sediment concentrations. In studies of the tolerance of crustaceans exposed to suspended sediments for up to two weeks, nearly all mortality was caused by the full-time exposure to high suspended sediment concentrations (greater than 10,000 mg/L) (Clarke and Wilber 2000), which would not occur from the in-water work associated with the proposed project (except perhaps extremely locally). Therefore, temporary increases in suspended sediment resulting from in-water construction activities would not be expected to result in significant adverse impacts to fish and mobile benthic macroinvertebrates.

SUMMARY

This policy is applicable because some project structure must be constructed in intertidal and subtidal shallows. Estimated impacts for open water and benthic habitats are summarized on Table 1. Because the project spans the Hackensack River and must intersect with existing rail infrastructure, there is no feasible alternative route that would not disturb intertidal and subtidal shallows.

7:7E-3.16: DUNES

A dune is a wind or wave deposited or man-made formation of sand (mound or ridge), that lies generally parallel to, and landward of , the beach and the foot of the most inland dune slope. "Dune" includes the foredune, secondary or tertiary dune ridges and mounds, and all landward dune ridges and mounds, as well as man-made dunes, where they exist.

1. Formation of sand immediately adjacent to beaches that are stabilized by retaining structures, and/or snow fences, planted vegetation, and other measures are considered to be dunes regardless of the degree of modification of the dune by wind or wave action or disturbance by development.

2. A small mound of loose, windblown sand found in a street or on a part of a structure as a result of storm activity is not considered to be a "dune."

Development is prohibited on dunes except for development that has no practicable or feasible alternative in an area other than a dune and will not cause adverse long-term impacts on the natural functioning of the beach dune system.

Dunes do not occur at the Portal Bridge Capacity Enhancement Project site. Therefore, this rule is not applicable.

7:7E-3.17: OVERWASH AREAS

An overwash area is an area subject to accumulation of sediment, usually sand, that is deposited landward of the beach or dune by the rush of water over the crest of the beach berm, a dune or a

structure. An overwash area may, through stabilization and vegetation, become a dune. Development is generally prohibited on overwash areas, except for development that has no prudent or feasible alternative in an area other than an overwash area, and that will not cause significant adverse long-term impacts on the natural functioning of the beach and dune system.

Overwash areas do not occur at the Portal Bridge Capacity Enhancement Project site. Therefore, this rule is not applicable.

7:7E-3.18: COASTAL HIGH HAZARD AREAS

Coastal high hazard areas are flood prone areas subject to high velocity waters (V zones) as delineated on the Flood Insurance Rate Maps (FIRM) prepared by the Federal Emergency Management Agency (FEMA), and areas within 25 feet of oceanfront shore protection structures, which are subject to wave run-up and overtopping. The Coastal High Hazard Area extends from offshore to the inland limit of a primary frontal dune along an open coast and any other area subject to high velocity wave action from storms or seismic sources. The inland limit of the V zone is defined as the V zone boundary line as designated on the FIRM or the inland limit of the primary frontal dune, whichever is most landward.

The Hackensack River area has not been identified as a Coastal High Hazard Area. Therefore, this rule is not applicable

7:7E-3.19: EROSION HAZARD AREAS

Erosion hazard areas are shoreline areas that are eroding and/or have a history of erosion, causing them to be highly susceptible to further erosion, and damage from storms.

This area of the Hackensack River is not defined as an Erosion Hazard Area. Therefore, this rule is not applicable.

7:7E-3.20: BARRIER ISLAND CORRIDOR

Barrier island corridors are the interior portions of oceanfront barrier islands, spits and peninsulas. Along the New Jersey Coast, headlands are located between Monmouth Beach, Monmouth County and Pt. Pleasant Beach, Ocean County.

The Hackensack River, by definition, is not a Barrier Island Corridor. Therefore, this rule is not applicable.

7:7E-3.21: BAY ISLANDS

Bay islands are islands or filled areas surrounded by tidal waters, wetlands, beaches or dunes, lying between the mainland and barrier island. Such islands may be connected to the mainland or barrier island by elevated or fill supported roads. Existing lagoon edges (N.J.A.C.7:7E-3.24) are not bay islands.

The Portal Bridge Capacity Enhancement Project does not occur between the mainland and an oceanic barrier island and thus does not meet the definition of a Bay Island. Therefore, this rule is not applicable.

7:7E-3.22: BEACHES

Beaches are defined as gently sloping areas of sand or other unconsolidated material, found on all tidal shorelines, including oceans, bays, and rivers and that extend landward from the MHW line to either a man-made feature or the seaward or bayward foot of dunes. Overall, development is prohibited on beaches.

The Hackensack River shoreline near the proposed project is either developed/armored or comprises steeply-sloped and partially vegetated banks typical of muddy, tidal marshes. The shoreline does not meet the definition of a beach. Therefore, this rule is not applicable.

7:7E-3.23: FILLED WATER'S EDGE

Filled water's edge areas are existing filled areas lying between wetlands or water areas, and either the upland limit of fill, or the first paved public road or railroad landward of the adjacent water area, whichever is closer to the water. Some existing or former dredged material disposal sites and excavation fill areas are filled water's edge. The "waterfront portion" is defined as a contiguous area at least equal in size to the area within 100 feet of navigable water, measured from the Mean High Water Line (MHWL). This contiguous area must be accessible to a public road and occupy at least 30 percent of its perimeter along the navigable water's edge.

While spans over the tidal Hackensack River and other waterbodies are elevated on structure to minimize impacts to wetlands, the existing filled railroad bed (e.g. adjacent to the Riverbend Wetlands Preserve) and other properties in the area that may be acquired to facilitate the project meet the definition of filled water's edge. These filled water's edge areas have been located at the site historically. No other alternative, less-impactful location for the project exists. The project acknowledges the public access component of this rule which is complicated by the geography of the site and railroad safety/security concerns. Public Trust Rights will be addressed in this assessment under N.J.A.C. 7:7E-8.11.

7:7E-3.24: EXISTING LAGOON EDGES

Existing lagoon edges are defined as existing man-made land areas resulting from the dredging and filling of wetlands, bay bottom and other estuarine water areas for the purpose of creating waterfront lots along lagoons for residential and commercial development.. Existing Lagoon Edges extend upland to the limit of fill, or the first paved public road or railroad generally parallel to the water area, whichever is less.

The Portal Bridge Capacity Enhancement Project is a transportation project and therefore, by definition, the Existing Lagoon Edge policy is not applicable.

7:7E-3.25: FLOOD HAZARD AREAS

Flood hazard areas are areas subject to flooding from the flood hazard area design flood, as defined by the Department under the Flood Hazard Area Control Act rules at N.J.A.C. 7:13. Flood hazard areas include those areas mapped as such by the Department, areas defined or delineated as an A or a V zone by the Federal Emergency Management Agency (FEMA), and any unmapped areas subject to flooding by the flood hazard area design flood. Flood hazard areas are subject to either tidal or fluvial flooding and the extent of flood hazard areas shall be determined or calculated in accordance with the procedures at N.J.A.C. 7:13-3. [Where flood hazard areas have been delineated by both the Department and FEMA, the Department delineations shall be used. Where flood hazard areas have not been delineated by the Department or FEMA, limits of the 100 year floodplain will be established by computation on a case-by-case basis. The seaward boundary shall be the mean high water line.

The Portal Bridge Capacity Enhancement Project occurs within both a floodplain and riparian zone (see N.J.A.C. 7:7E-3.26 below). Although a bridge is not specifically identified as a "water dependent use" at N.J.A.C. 7.7E-1.8, the rule provides a test for water dependency. The test for water dependency shall assess both the need of the proposed use for access to the water and the capacity of the proposed water body to satisfy the requirements and absorb the impacts of the proposed use. A proposed use will not be considered water dependent if either the use can function away from the water or if the water body proposed is unsuitable for the use. In this case, because the proposed project includes a segment of the existing Northeast Corridor and must cross the Hackensack River, water dependency is affirmed. Furthermore, the water body can absorb the proposed use because the project area includes an existing rail bridge. Lastly, the proposed project crosses a tidal river, and as such is not subject to flood storage volume displacement limits per the policy at N.J.A.C. 7:13-10.4(d). Other impacts to flood hazard areas (e.g. vegetation in the riparian zone) would be mitigated in accordance with applicable regulations (i.e., N.J.A.C. 7:13) and in consultation with the NJDEP.

7:7E-3.26: RIPARIAN ZONES

A riparian zone exists along every regulated water, except there is no riparian zone along the Atlantic Ocean nor along any manmade lagoon, stormwater management basin, or oceanfront barrier island, spit or peninsula. Regulated waters are defined in the Flood Hazard Area Control Act rules at N.J.A.C. 7:13-2.2.

The riparian zone includes the land and vegetation within each regulated water described in (a) above, as well as the land and vegetation within a certain distance of each regulated water as described in below. The portion of the riparian zone that lies outside of a regulated water is measured landward from the top of bank.

The width of the riparian zone along each regulated water described in (a) above is as follows:

1. The riparian zone is 300 feet wide along both sides of any Category One water, and all upstream tributaries situated within the same HUC-14 watershed;

2. The riparian zone is 150 feet wide along both sides of the following waters not identified above:

i. Any trout production water and all upstream waters (including tributaries);

ii. Any trout maintenance water and all upstream waters (including tributaries) within one linear mile as measured along the length of the regulated water;

iii. Any segment of a water flowing through an area that contains documented habitat for a threatened or endangered species of plant or animal, which is critically dependent on the regulated water for survival, and all upstream waters (including tributaries) within one linear mile as measured along the length of the regulated water; and

iv. Any segment of a water flowing through an area that contains acid producing soils; and

3. The riparian zone is 50 feet wide along both sides of all waters not identified in 1 or 2 above.

The Portal Bridge Capacity Enhancement Project crosses the riparian zone of the Hackensack River. According to the policy for determining the riparian zone at N.J.A.C. 7:13-4.1, the portion of the riparian zone that occurs outside the regulated water is measured landward of the top of bank.

The proposed project is not in Category One water; therefore, the 300-foot riparian zone established at N.J.A.C. 7:13-4.1 does not apply. Category One waters are defined in the existing Surface Water Quality Standards rules at N.J.A.C. 7:9B-1.4 as "those waters designated in the tables in N.J.A.C. 7:9B-1.15(c) through (h), for purposes of implementing the antidegradation policies set forth in N.J.A.C. 7:9B-1.5(d), for protection from measurable changes in water quality characteristics because of their clarity, color, scenic setting, other characteristics of aesthetic value, exceptional ecological significance, exceptional recreational significance, exceptional water supply significance, or exceptional fisheries resource(s).”

The 150-foot riparian zone established at N.J.A.C. 7:13-4.1 does not apply, because the project area is not: a) trout production or maintenance waters; b) documented habitat for a threatened or endangered species (see discussion below under Policy N.J.A.C. 7:7E-3.38 (‘Endangered or Threatened Wildlife or Vegetation Species Habitats); or c) flowing through an area with acid producing soils.

The riparian zone policy at N.J.A.C. 7:13-4.1 establishes a 50-foot riparian zone for all waters not requiring the more stringent 300-foot or 150-foot zones; therefore, the riparian zone for the proposed project is 50 feet wide.

Project elements within the riparian zone will conform to the requirements at N.J.A.C. 7:13, as appropriate. Vegetation lost within the riparian zone (if any) due to project elements will be mitigated for under the project’s overall mitigation plan.

7:7E-3.27: WETLANDS

Wetlands or wetland means an area that is inundated or saturated by surface water or groundwater at a frequency and duration sufficient to support, and that under normal circumstances does support, a prevalence of vegetation typically adapted for life in saturated soil conditions, commonly known as hydrophytic vegetation. Development in wetlands defined under the Freshwater Wetlands Protection Act of 1987 is prohibited unless the development is found to be acceptable under the Freshwater Wetlands Protection Act Rules (N.J.A.C. 7:7A). Development of all kinds in all other wetlands not defined is prohibited unless the Department can find that the proposed development meets the following conditions:

- *Requires water access or is water oriented as a central purpose of the basic function of the activity;*
- *Has no prudent or feasible alternative on a non-wetland site;*
- *Will result in minimum feasible alteration or impairment of natural tidal circulation (or natural circulation in the case of non-tidal wetlands); and*
- *Will result in minimum feasible alteration or impairment of natural contour or the natural vegetation of the wetlands.*

If an application to disturb or destroy wetlands meets the standards for permit approval, the Department will require the applicant to mitigate for the loss or degradation of the wetlands. All mitigation proposals submitted to the Department shall be prepared in accordance with N.J.A.C. 7:7E-3B.

The following types of permanent wetland impacts would be expected from the build alternatives:

- Permanent loss of wetland habitat within caissons and/or pile footprints and from embankments and retaining walls;
- Shading of wetland habitat from new overhead structures;

The estimated permanent impacts to wetlands are presented in Table 1 (in the category "wetlands") above for each build alternative.

PERMANENT LOSS OF WETLAND HABITAT

The permanent loss of wetlands in the form of wetlands fill would be expected due to the installation of bridge support piles and creation of new embankments. The estimated acreage of permanent wetland loss (fill) for each alternative is presented above in Table 1. These losses would include open water, deciduous scrub/shrub wetlands, *Phragmites*-dominated interior wetlands, *Phragmites*-dominated coastal wetlands, herbaceous wetlands. The areas of direct wetlands loss (i.e. filled) range from 5.4 acres for Alternative DE to 6.4 acres for Alternative FS.

These losses are unavoidable because of the need for the proposed spans to traverse wetland areas, and especially tidal wetlands in or adjacent to the Riverbend Wetland Preserve. These wetlands contain *Phragmites*-dominated coastal wetlands, as well as areas of *Spartina alterniflora* and other halophyte marsh vegetation. To the extent safely practicable, the filling of these wetlands was minimized by design through the use elevated structure rather than a rail bed placed on structural fill (such as the fill supporting the existing eastern bridge approach). Nevertheless, some caissons or pilings will be required in these wetland areas to support the elevated structures. NJ TRANSIT intends to mitigate these impacts through restoration at nearby sites identified as restoration candidates by NJDEP and other stakeholders. This mitigation may include portions of the Kane Tract mitigation bank, among others.

SHADING OF WETLAND HABITAT BY OVERHEAD STRUCTURE

The effects of shading on emergent and saline wetlands vary according to the degree of shading. Factors influencing shading include the width and height of the overhead obstruction, as well as the directional orientation of the shading structure. Depending on the amount of shade involved, impacts to vegetation

can range from no discernable effect to complete loss of vegetation. In addition, even minor changes to the degree of shading to a wetland area can potentially improve the competitive advantage of invasive species over natives (Weihe and Neely 1997) or exacerbate other stressors such as water-logging (Lenssen et al 2003).[27, 28] Additionally, shading may adversely affect, or be exploited by, certain fauna that occupy wetland habitats.

While qualitative effects of shading are widely known, there has been little apparent effort in broad-based development of objective standards by which the structural parameters of an overhead structure (e.g. height to width ratios, directional orientation, effective opacity, etc.) are correlated to environmental impact. In two recent research projects, however, steps to establishing a threshold value for height to width (HW) ratios have been taken. Both studies were conducted in marshes shaded by highway bridges and in adjacent reference sites in North Carolina (Struck et al. 2004 and Sanclements, M.D. 2003).[29, 30] Both studies present data that support a HW ratio of 0.7 as a threshold for impacts, below which impacts were statistically significant. Overhead structures with a HW ratio greater than 0.7 did not appear to result in substantial shading impact to the underlying marsh.

Since this ratio was developed from studies in marsh systems with vegetative and faunal community structures similar to those of the Hackensack Meadowlands, and because the HW ratio for vegetation and faunal appear to converge on a common ratio, this value was used for estimating wetland shading impacts from the proposed project. The estimation of shading effects relies on this value, as well as the widths, heights, and lengths of proposed structures, to calculate an estimate of newly shaded area. Although the actual shaded area will vary by time of year, time of day, and the north/south orientation of the span, these variables are implicit in the 0.7 HW ratio threshold recommended in the studies above. Wetland shading impacts range from an estimated 1.5 acres for alternative FE to 1.9 acres for alternative DS.

SUMMARY

The Portal Bridge Capacity Enhancement Project will affect tidal and non-tidal wetlands. The proposed project is water-oriented (river crossing via a bridge). Prudent and feasible alternatives for crossing the Hackensack River do not exist. The proposed project design was developed, to the extent practical, to minimize impacts from fill and shading in wetlands and tidal circulation within them. For wetland impacts not mitigated by design, NJ TRANSIT intends to mitigate these impacts through restoration at nearby sites identified as restoration candidates by NJDEP and other stakeholders. This mitigation may include portions of the Kane Tract mitigation bank, among others.

7:7E-3.28: WETLANDS BUFFERS

Wetlands buffer or transition area means an area of land adjacent to a wetland which minimizes adverse impacts on the wetlands or serves as an integral component of the wetlands ecosystem. Wider buffers than those noted below may be required to establish conformance with other Coastal Rules, including, but not limited to, 7:7E-3.38 and 3.39.

1. A wetlands buffer or transition area of up to 150 feet in width shall be established adjacent to all wetlands defined and regulated under the Freshwater Wetlands Protection Act.

[30] Sanclements. M.D. Effects of Shading by Bridges on Estuarine Wetlands. Masters Thesis – North Carolina State University – Soil Science. Raleigh, N.C. 2003

2. For all other wetlands, including wetlands regulated under the Coastal Wetlands Act of 1970, a wetlands buffer of up to 300 feet shall be established.

Based on the fact that the study area is highly developed with a number of linear features—such as railroads, paved access roads, utility rights-of-way, and man-made earthworks—the project believes that there are no impacts to wetland buffers (although there are impacts to wetlands and open water areas). The wetland areas within the project area are essentially defined by these linear features (e.g. the Kearny Brackish Marsh, which is surrounded by a dike). The presence or absence of wetland buffers that could be impacted by the proposed project will be confirmed during the permitting process and the need for mitigation measures will be coordinated with the project stakeholders.

7:7E-3.29 (RESERVED)

7:7E-3.30 (RESERVED)

7:7E-3.31: COASTAL BLUFFS

A coastal bluff is a steep slope (greater than 15 percent) of consolidated (rock) or unconsolidated (sand, gravel) sediment which is adjacent to the shoreline or which is demonstrably associated with shoreline processes.

1. The waterward limit of a coastal bluff is a point 25 feet waterward of the toe of the bluff face, or the mean high water line, whichever is nearest the toe of the bluff.

2. The landward limit of a coastal bluff is the landward limit of the area likely to be eroded within 50 years, or a point 25 feet landward of the crest of the bluff, whichever is farthest inland (see Appendix, Figures 7 and 8, incorporated herein by reference).

3. Steep slopes (N.J.A.C. 7:7E-3.34) are isolated inland areas with slopes greater than 15 percent. All steep slopes associated with shoreline processes or adjacent to the shoreline and associated wetlands, or contributing sediment to the system, will be considered coastal bluffs.

There are no Coastal Bluffs on, or within close proximity to the Portal Bridge Capacity Enhancement Project. Therefore, this rule is not applicable.

7:7E-3.32: INTERMITTENT STREAM CORRIDORS

Intermittent stream corridors are areas including and surrounding surface water drainage channels in which there is not a permanent flow of water and which contain an area or areas with a seasonal high water table equal to or less than one foot. The inland extent of these corridors is either the inland limit of soils with a seasonal high water table depth equal to, or less than one foot, or a disturbance of 25 feet measured from the top of the channel banks, whichever is greater.

Intermittent streams do not occur on the Portal Bridge Capacity Enhancement Project site. Therefore, this rule is not applicable.

7:7E-3.33: FARMLAND CONSERVATION AREAS

Farmland conservation areas are defined as any contiguous area of 20 acres or more (in single or multiple tracts of single or multiple ownership) with soils in the Capability Classes I, II and III or special soils for blueberries and cranberries as mapped by the United States Department of Agriculture, Soil Conservation Service, in National Cooperative Soil Surveys, which are actively farmed, or suitable for farming, unless it can be demonstrated by the applicant that new or continued use of the site for farming or farm dependent purposes is not economically feasible. Farming or farm-dependent purposes include nurseries, orchards, vegetable and fruit farming, raising grains and seed crops, silviculture (such as Christmas tree farming), floriculture (including greenhouses), dairying, grazing, livestock raising, and wholesale and retail marketing of crops, plants, animals and other related commodities.

Farmland Conservation Areas do not occur on or near the Portal Bridge Capacity Enhancement Project site. Therefore, this rule is not applicable.

7:7E-3.34: STEEP SLOPES

Steep slopes are land areas with slopes greater than 15 percent, which are not adjacent to the shoreline and therefore not coastal bluffs (see N.J.A.C. 7:7E-3.31). Steep slopes include natural swales and ravines, as well as manmade areas, such as those created through mining for sand, gravel, or fill, or road grading. Slopes of less than 15 percent are not considered to be steep slopes.

Steep Slopes do not occur at the Portal Bridge Capacity Enhancement Project site. Therefore, this rule is not applicable.

7:7E-3.35: DRY BORROW PITS

Dry borrow pits are excavations for the purpose of extracting coastal minerals which have not extended below the groundwater level. This includes, but is not limited to, dry sand, gravel and clay pits, and stone quarries.

Dry Borrow Pits do not occur at the Portal Bridge Capacity Enhancement Project site. Therefore, this rule is not applicable.

7:7E-3.36: HISTORIC AND ARCHAEOLOGICAL RESOURCES

Historic and archaeological resources include objects, structures, shipwrecks, buildings, neighborhoods, districts, and man-made or man-modified features of the landscape and seascape, including historic and prehistoric archaeological sites, which either are on or are eligible for inclusion on the New Jersey or National Register of Historic Places.

Development that detracts from, encroaches upon, damages, or destroys the value of historic and archaeological resources is discouraged, while adaptive reuse is encouraged. Mitigation measures must take place if the proposed development will irreversibly and/or adversely affect historic and archaeological resources.

The Portal Bridge Capacity Enhancement Project has the potential to affect historic and archaeological resources. Table 2 presents a summary of potential impacts to historic resources in the study area. Figure 13 shows the location of these resources.

Table 2
Potential Impacts to Historic Resources within Study Area

Ref No	Resource Name	Designation Status	May be Adversely Affected by Build Alternatives	No Adverse Effects Anticipated
KNOWN ARCHITECTURAL RESOURCES				
1	Pennsylvania Railroad New York to Philadelphia Historic District	S/NR-Eligible	X	
2	Portal Bridge	SR-Listed/ NR-Eligible	X	
3	Old Main DL&W Railroad Historic District	S/NR-Eligible		X
4	Hudson & Manhattan Railroad	S/NR-Eligible		X
5	WMCA 570 Radio Station Relay/Transmitter Building	S/NR-Eligible		X
6	Substation 4 (Amtrak Substation 41)	S/NR-Eligible	X	
7	Jersey City Waterworks Pipeline	S/NR-Eligible	X	
8	Former Edison Battery Property (Standard Chlorine Chemical Company property)*	S/NR-Eligible		X

Notes: See Figure 13 for reference.
*As described in the MOA for the project, other concurrently planned projects may affect the former Edison Battery Company Property, and such effects, if they occur, could constitute a cumulative adverse effect.

As mandated by Section 106 of the NHPA of 1966, Amtrak and NJ TRANSIT have participated in an ongoing consultation process with the NJHPO with respect to potential effects on archaeological and architectural resources. As part of this ongoing process, measures will be explored to avoid or minimize to the extent practicable any significant adverse effects to archaeological and architectural resources. Development of these mitigation measures is set forth in a draft MOA, to be executed by FRA, NJHPO, Amtrak, and NJ TRANSIT.

The MOA lists the historic resources that may be affected by the project and also describes the continuing consultation process that will be conducted as project designs evolve. The MOA also describes the measures to be implemented during the project's design process, to avoid, minimize, or mitigate adverse effects of the project on historic resources.

Amtrak and NJ TRANSIT will implement the various provisions of the MOA. These include:

1. Ongoing consultation with NJHPO with respect to the design of project elements that could disturb archaeologically sensitive areas, physically alter architectural resources, or affect the context or setting of an architectural resource, including those potential adverse effects identified on the Historic Cemeteries of Hudson County, the Portal Bridge, the Northeast Corridor, Substation 4, and the Jersey City Waterworks Pipeline;

2. Development and implementation of the Construction Protection Plan (CPP) to avoid inadvertent construction-period impacts on the Jersey City Waterworks Pipeline and Substation 4. The CPP would be developed in consultation with NJHPO by a licensed professional engineer prior to any project construction occurring within 90 feet of Substation 4. The CPP would include provisions for pre-construction inspection and documentation, vibration, settlement, and crack monitoring, as appropriate and stop-work orders.

3. Where adverse effects to architectural resources cannot be avoided, mitigation measures would be developed and implemented as per the provisions of the MOA. Mitigation for adverse effects on the Portal Bridge and Pennsylvania Railroad Historic District would include Historic American Engineering Record (HAER) documentation for Portal Bridge and the portions of the Pennsylvania Railroad Historic District within the APE; ongoing consultation with NJHPO regarding the design of the new bridge; salvage of elements of the affected historic resources; development of an interpretive exhibit in a park, greenway, or public space, that would present the history of the Pennsylvania Railroad and Portal Bridge, that could include but would not be limited to salvaged elements of these resources and signage; and additional documentation interpreting the history and significance of the Portal Bridge and Pennsylvania Railroad Historic District in the form of a website.

4. Where locations identified as containing burials cannot be avoided, Amtrak and NJ TRANSIT will follow the procedures identified in the MOA concerning testing and excavation to avoid any insensitive disturbance to human remains in the Historic Cemeteries of Hudson County, including, but not limited to, conducting outreach to and consulting with appropriate descendant communities prior to any archaeological testing and construction, preparing a testing plan for review by NJHPO, and requiring a physical anthropologist/forensic archaeologist to be on-call or on-site in the event that skeletal material is encountered during archaeological testing or project construction. The Historic Cemeteries of Hudson County fall within the jurisdiction of the New Jersey Cemetery Act, Title 8A for the New Jersey Statutes (N.J.S.) (State of New Jersey 2002). The New Jersey Cemetery Board administers the Act, and the New Jersey Attorney General oversees actions and proceedings of the Cemetery Board. Any disinterment and reinterment would also require approval by the Chancery Division of the Superior Court of New Jersey.

7:7E-3.37: SPECIMEN TREES

Specimen trees are the largest known individual trees of each species in New Jersey. The Department's Division of Parks and Forestry maintains a list of these trees (see "New Jersey's Biggest Trees", published by the Department's Division of Parks and Forestry, Summer 1991 for a listing of specimen trees). In addition, large trees approaching the diameter of the known largest tree shall be considered specimen trees. Individual trees with a circumference equal to or greater than 85 percent of the circumference of the record tree, as measured 4.5 feet above the ground surface, for a particular species shall be considered a specimen tree.

There are no specimen trees in the vicinity of the Portal Bridge Capacity Enhancement Project. Therefore this rule is not applicable.

7:7E-3.38: ENDANGERED OR THREATENED WILDLIFE OR VEGETATION SPECIES HABITATS

Endangered or threatened wildlife or plant species habitats are areas known to be inhabited on a seasonal or permanent basis by or to be critical at any stage in the life cycle of any wildlife or plant identified as "endangered" or "threatened" species on official Federal or State lists of endangered or threatened species, or under active consideration for State or Federal listing. The definition of endangered or threatened wildlife or plant species habitats include a sufficient buffer area to ensure continued survival of the population of the species. Absence of such a buffer area does not preclude an area from being endangered or threatened wildlife or plant species habitat.

The New Jersey Landscape Project dataset does not identify threatened or endangered species within the project area. The northern edge of an area listed by the NJDEP's Landscape Project – Urban Peregrine Falcon (2002) as suitable foraging habitat for the State-endangered peregrine falcon is identified approximately 1,500 feet south of the project area (http://njgin.nj.gov/dep/DEP_iMapNJDEP/viewer.htm). The identified area is centered on PSEG's Kearny Generating Station (apparent nesting site), and includes a foraging area with a radius of approximately 3,280 feet (1,000 meters). It is not known if this site (which is outside of the Portal Bridge's study area) is in current or continuous use by peregrine falcons; however, these raptors are common in urban areas, and nesting in New Jersey has been generally successful (NJDEP 2006). Additionally, in the summer of 2007, the first successful nesting of ospreys in the Hackensack Meadowlands in over 50 years was observed. Two juveniles fledged from a nest in Jersey City's Penhorn Creek area near the Hackensack River (approximately one mile from the project site). Because ospreys are exclusively piscivorous (i.e., fish-eating) the nesting success has been hailed as a sign of improving water quality in the region (Hudson County 2007, personal communication).

In addition, the following agencies were consulted regarding the presence or absence of threatened or endangered species or other species of particular concern within the project study area: National Oceanographic and Atmospheric Administration's (NOAA) National Marine Fisheries Service (NMFS), United States Fish and Wildlife Service (USFWS), and NJDEP Natural Heritage Program (see Attachment 1 of this evaluation).

The project sponsors acknowledge the potential for a number of T&E species and other species of concern remains within the project area. The project team will comply with regulatory-restricted periods assuming a demonstrative impact on a given species. The project team will work in consultation with the NJDEP to evaluate the presence/absence of key species and adjust construction methods and schedule to reduce impacts to T&E birds or fish based on their seasonal presence in the project area.

7:7E-3.39: CRITICAL WILDLIFE HABITATS

Critical wildlife habitats are specific areas known to serve an essential role in maintaining wildlife, particularly in wintering, breeding, and migrating. These include:

1. Rookeries for colonial nesting birds, such as herons, egrets, ibis, terns, gulls, and skimmers; stopovers for migratory birds, such as the Cape May Point region; and natural corridors for wildlife movement merit a special management approach through designation as a Special Area.

2. Ecotones, or edges between two types of habitats, are a particularly valuable critical wildlife habitat. Many critical wildlife habitats, such as salt marsh waterfowl wintering areas, and muskrat habitats, are singled out as water or water's edge areas.

3. Definitions and maps of critical wildlife habitats are currently available only for colonial waterbird habitat in the 1979 Aerial Colony Nesting Waterbird Survey for New Jersey (NJDEP, Division of Fish and Wildlife). Until additional maps are available, the Division of Fish and Wildlife will consider sites on a case-by-case basis.

Development that would directly or through secondary impacts on the relevant site or in the surrounding region adversely affect critical wildlife habitats is discouraged, unless:

- *Minimal feasible interference with the habitat can be demonstrated;*
- *There is no prudent or feasible alternative location for the development; and*
- *The proposal includes appropriate mitigation measures.*

At present, definitions and maps of critical wildlife habitats are currently available only for colonial waterbird habitat in the 1979 Aerial Colony Nesting Waterbird Survey for New Jersey (NJDEP, Division of Fish and Wildlife). Until additional or more recent maps are available, sites will be considered on a case-by-case basis by the Division of Fish and Wildlife. As such, this policy may be applicable pending NJDEP review. The proposed project will minimize disturbance to habitat to the extent feasible, and will include appropriate mitigation measures as appropriate and agreed upon by project stakeholders.

One potential impact of the project to wetland and other habitat areas involves the fragmentation of contiguous habitat. Habitat segmentation can occur when a linear development isolates one or more areas of contiguous habitat. The effects of fragmentation can range from the reproductive isolation of sub-populations of affected plants and animals to loss of refuge or breeding habitat associated with habitat interior regions. In the United Kingdom, researchers found that fragmented wetland habitat severely constrained the dispersal limits of threatened gastropod mollusks (Niggebrugge et al. 2007).[31] The genetic consequences of wetland habitat fragmentation are not well understood; however, the authors caution that even small genetic consequences can be critical to threatened or endangered species limited to particular habitats. In New England, wetland habitat partitioning was found to have a negative effect on salt marsh bird diversity, with fragmented habitats having significantly lower species richness than larger contiguous marsh areas (Shriver et al. 2004).[32] This general finding is consistent with other similar studies in forest, grassland, and freshwater wetland communities. Habitat fragmentation also leads to an increase in habitat "edge" density. Habitat edge is the boundary between on type of monotypic habitat and another. In natural settings, where one habitat type transitions into another, these edges are often called "ecotones," and are though to represent areas of high biological diversity and abundance (Johnston and Odum 1956).[33] In human-impacted environments; however, the edges are often abrupt when they are caused by a linear

[31] Niggebrugge, K., I. Durance, A.M. Watson, R.S.E.W. Leuven, and S.J. Ormerod. Applying landscape ecology to conservation biology: Spatially explicit analysis reveals dispersal limits on threatened wetland gastropods. *Biological Conservation.* 139:286-296. 2007.

[32] Shriver, W.G., T.P. Hodgman, J.P. Gibbs, and P.D. Vikery. Landscape context influences salt marsh bird diversity and area requirements in New England. *Biological Conservation.* 119:545-553. 2004.

[33] Johnston, D.W. and E.P. Odum. Breeding bird populations in relation to plant succession on the Piedmont of Georgia. *Ecology*. 37: 50–62. 1956.

development feature (e.g., the edge of an agricultural field, a railroad, electrical transmission lines, etc.). The increased fragmentation of these habitats by man-made features can lead to an overabundance of edge, with potentially deleterious effects. As one example, while proximity to edge habitat has been observed to be beneficial to nesting birds, the presence of edge also increases predation by providing access to interior regions of forests used by prey and by serving as corridors for movement (Gates and Gysel 1978, Johnston and Odum 1956).[34] A more recent study of nesting ducks in mid-west marshes failed to document increased predation as a function of edge proximity; however a preference for nesting sites near the wetland edge (within the wetlands) was observed for several duck species (Pasitschniak-Arts et al. 1998).[35] Nevertheless, such a preference for edge could increase vulnerability to predation given a different predator mix or a higher degree of habitat fragmentation (i.e., a higher edge to area ratio).

While habitat segmentation is often unavoidable for linear development features such as roads and railroads, to the extent practical, the proposed project minimizes segmentation by design through the use of elevated structures as opposed to fill. This is particularly germane to the potential segmentation of large, contiguous tidal wetland areas in and near the Riverbend Wetland Preserve. The elevated nature of the span in the tidal wetlands greatly reduces the likelihood of habitat segmentation.

7:7E-3.40: PUBLIC OPEN SPACE

Public open space constitutes land areas owned or maintained by State, Federal, county and municipal agencies or private groups (such as conservation organizations and homeowner's associations) and used for or dedicated to conservation of natural resources, public recreation, visual or physical public access or, wildlife protection or management. Public open space also includes, but is not limited to, State Forests, State Parks, and State Fish and Wildlife Management Areas, lands held by the New Jersey Natural Lands Trust (N.J.S.A. 13:1B-15.119 et seq.), lands held by the New Jersey Water Supply Authority (N.J.S.A. 58:1B-1 et seq.) and designated Natural Areas (N.J.S.A. 13:1B-15.12a et seq.) within DEP-owned and managed lands.

The Portal Bridge Capacity Enhancement Project involves traversing several areas owned or maintained by State and municipal agencies that are used for or dedicated to conservation of natural resources, public recreation, visual or physical public access or, wildlife protection or management.

The build alternatives would require an increase to the size of the existing rail right-of-way through the study area and this would involve acquisition and conversion to transportation use of narrow areas of parkland and wetland preserve along the existing right-of-way. Effects on specific parks and preserve areas would be as follows.

- **Cedar Creek Marsh:** Alternatives FE and FS would require acquisition of a narrow strip of Cedar Creek Marsh immediately adjacent to the existing rail right-of-way to accommodate a track connection associated with the flyover.
- **Kearny Brackish Marsh/Cayuga Dike:** All four build alternatives would also require acquisition of 2.5 acres to accommodate bridge piers supporting a viaduct above the preserve.
- **Riverbend Wetland Preserve:** The two southern alignment alternatives, Alternatives FS and DS, would require acquisition of a 4.7-acre portion of this wetland preserve to accommodate an overhead viaduct supported on piers. The piers would be located within, but would not occupy all of, the 4.7 acres to be acquired.

[34] Gates, J.E. and L.W. Gysel. Avian nest dispersion and fledging success in field-forest ecotones. Ecology. 58: 871–883. 1978.

[35] Pasitschniak-Arts, M., R.G. Clark, and F. Messier. Duck nesting success in a fragmented prairie landscape: is edge effect important? Biological Conservation. 85: 55-62. 1998.

- **Hudson County Park at Laurel Hill:** All four build alternatives would require the acquisition of 2.0 acres of the 14.9-acre expansion area at Laurel Hill Park to accommodate the approach to the new northern bridge. As described earlier in the discussion of the No Action Alternative, Hudson County has conceptual plans to enhance the wetlands in this area and to create a new boardwalk and fishing pier along the shoreline. While the Portal Bridge project would need to coordinate its construction with that of the planned park, none of the build alternatives would preclude implementation of Hudson County's plans for the expanded park. This parcel of land was purchased by Hudson County under the Green Acres Program, and therefore, mitigation of this loss of parkland requires special coordination with NJDEP. NJ TRANSIT and Amtrak have also initiated discussion with Hudson County on potential measures to mitigate the loss of this parkland including possible sites for compensatory parkland and/or open space as well as physical improvements (i.e. access, recreational or infrastructure facilities, etc) at the existing and future Laurel Hill Park. Other possible areas for open space mitigation include opportunities for the project to provide waterfront access to the west side of the Hackensack River. The project sponsors will continue to work with the county and other stakeholders on these various potential mitigation measures as the Portal Bridge Capacity Enhancement Project proceeds into preliminary engineering allowing for a more refined design of the areas surrounding the bridge structures.

7:7E-3.41: SPECIAL HAZARD AREAS

Special hazard areas include areas with a known actual or potential hazard to public health, safety, and welfare, or to public or private property, such as the navigable air space around airports and seaplane landing areas, potential evacuation zones and areas where hazardous substances as defined at N.J.S.A. 58:10-23.11b-k are used or disposed, including adjacent areas and areas of hazardous material contamination.

The Portal Bridge Capacity Enhancement Project will disturb soils and sediments known to be contaminated.

The following narrative summarizes conditions at and adjacent to the project site, based on the results of records research and review of previous investigations of sites in the vicinity, as well as discussions with property owners and regulatory agencies. For the larger secondary study area, which includes primarily commercial and industrial sections of Kearny and Secaucus, a review of federal and state environmental agency databases was conducted. The following areas, all in close proximity to the project site and potentially subject to direct disturbance (e.g., excavation) associated with one or more build alternatives, are discussed in terms of history, known contamination, jurisdiction, remediation plans, etc.

The following sites, all in close proximity to the project site and potentially subject to direct disturbance (e.g., excavation) associated with one or more build alternatives, are discussed below in terms of history, known contamination, jurisdiction, remediation plans, etc.

AMTRAK'S RIGHT-OF-WAY

Amtrak owns right-of-way adjacent to the Northeast Corridor. Contamination within rail rights-of-way typically comes from a variety sources—leakage of diesel fuel from locomotives, leakage of lubricating or transformer oils from trains, contaminated material leakage from freight cars or contamination from stationary sources within the right-of-way (including the fill materials used to construct/elevate the right-of-way). The Northeast Corridor in the vicinity of the Portal Bridge has been electrified since its construction in 1900, and has not been used by freight traffic, greatly reducing the potential for contamination from railroad operations.

There is also the potential for contamination (including lead-based paint, asbestos-containing materials or PCBs or other oil-containing equipment) associated with ancillary structures to the railroad, such as signal towers, and power generation/transformer facilities. Prior studies performed on behalf of Amtrak

recommended that a Phase II ESA be conducted within the railroad corridor to determine the level of contaminants in the soil and groundwater prior to construction activities.

DIAMOND SHAMROCK, STANDARD CHLORINE, KOPPERS COKE AND HACKENSACK RIVER SEDIMENTS

The 27-acre "Diamond Shamrock" property is located immediately west of the Hackensack River bordering the southern boundary of the existing Amtrak railroad embankment. Until 1976, the property was used for the production of leather tanning chemicals (sodium dichromate and potassium dichromate). The majority of the buildings on the property were demolished in 1978. The site is covered with 8 to 10 feet of fill comprised of chromium laden slag and silty sand. The Occidental Chemical Corporation (successor to the Diamond Shamrock Corporation) owns the site and remediation is being overseen by Tierra Solutions under jurisdiction of NJDEP. The Diamond Shamrock property is also referred to as "Site 113" and is one of several chromium-contaminated properties in the area. Investigation and remediation of this property has been and may to some extent continue to be tied to that of the two properties to the south (and thus farther from the proposed project). These other sites are known as "Standard Chlorine" and "Koppers Coke" (also known as the "Seaboard Site").

The 25-acre Standard Chlorine site is bound by the Belleville Turnpike (State Route 7), the Koppers Coke, and Diamond Shamrock sites, and the Hackensack River, and was used over the years for manufacturing items such as naphthalene products, creosote disinfectants, mothballs (dichlorobenzene), drain cleaner products, lead acid batteries, raw rubber parts, and dye carriers. NJDEP identified several areas of concern at the site including on-site lagoons, chromium ore processing residues, soil contaminated with dioxins, volatile and semi-volatile organic compounds, and semi-volatile organic compounds, contaminated concrete, groundwater contamination (including dense non-aqueous phase liquid [DNAPL]), contaminated drainage ditch surface water, and migration of contamination to the Hackensack River surface water and sediments. Remediation is expected to include installation of a hydraulic barrier along the Hackensack River and around the perimeter of the two sites to prevent potential migration of DNAPL and impacted groundwater from the two sites to the river. In a rulemaking published in the *Federal Register* on September 19, 2007, the Standard Chlorine site was added to the Superfund program's National Priorities List (NPL). It is not currently clear to what extent remediation of Standard Chlorine will be coordinated with that of Diamond Shamrock. Remediation will likely include construction of a perimeter hydraulic barrier, a groundwater recovery and treatment system, lagoon cleanup, sediment cleanup, surface cover, and stormwater management. This site is also known as COPR Site 116.

The 155-acre Koppers Coke site was a coke plant and coal tar processing facility. Portions of the site are still in active use, including a marine loading facility along the eastern portion of the site. Existing contamination includes: dense and light non-aqueous phase liquids (NAPL); impacted soils (primarily VOCs in the former coke and light oil refining areas and PAHs in the former coal tar processing areas); and surface disposal of process and waste materials (coal tar waste, chromium-contaminated fill, and oil deposit areas). A remedial action work plan (RAWP) was submitted to NJDEP in 1997 and approved in 1998. Additional remedial actions have subsequently been proposed and approved. Proposed remedial actions include placement of a cover of processed dredged material (PDM), a subsurface barrier system along the Hackensack River, and recovery of NAPL. Portions of the RAWP have been implemented, including the installation and operation of a NAPL recovery system.

The sediments in portions of the Hackensack River adjacent to the Diamond Shamrock, Standard Chlorine, and Koppers Coke sites have been impacted by a variety of contaminants. The Peninsula Restoration Group prepared a Hackensack River Study Area Remedial Investigation Work Plan in December 2005 to determine the extent and type of contamination present in these sediments, and to conduct a screening level ecological risk assessment. Removal of river sediments within 50 feet of shore

to a depth of three feet adjacent to the Diamond Shamrock and Standard Chlorine sites was proposed as part of the most recent work plans. Remedial investigation activities have been implemented in this area.

JANA CORPORATION AND OTHER POTENTIAL CHROMIUM SITES

The Jana Corporation property is located immediately west of the Hackensack River bordering the northern boundary of the existing Amtrak railroad embankment. The site was formerly part of the Kearny Drum Dump, is listed as a CERCLIS-No Further Remedial Action Planned (NFRAP) site and includes institutional controls. NFRAP sites that were considered for NPL listing but were not ultimately listed due to the large number of heavily contaminated sites that were eligible for listing. Additionally, this site is one of the chromite ore processing residue (COPR) sites mentioned above, and is also referred to as "Site 50." There are nine COPR sites in the vicinity of the Portal Bridge—Sites 47, 48, 50, 51, 58, 103, 113, 116, and 131. The primary contaminant of concern at these sites is hexavalent chromium.

Site 47 (Goldie's Auto Parts), Site 48 (Clinton Cartage), and Site 58 (Nicole's Warehouse) are located to the west of the Diamond Shamrock site and are occupied by commercial businesses. Site 113 (Diamond Shamrock) and Site 116 (Standard Chlorine) were discussed in more detail above. Site 51 is located adjacent to the Jana Corporation property. Site 103 comprises a portion of the Amtrak Access Road, which runs parallel to the existing Northeast Corridor. Site 131 is a north-south access road adjacent to the Hackensack River. Although each of these nine COPR sites have different property owners, they are all part of an investigation and remediation effort in accordance with a Consent Order between NJDEP and the representatives of the Diamond Shamrock property owner. Based on information provided during the DEIS comment period, these sites have been thoroughly characterized and remedial investigation reports are under review by NJDEP. While remedial actions have not yet been implemented, caps have been installed at each site to limit hexavalent chromium exposure.

LANDFILLS

Several closed landfills are located immediately adjacent to the Amtrak right-of-way, including the 1A Landfill west of the Hackensack River and the Malanka Landfill east of the Hackensack River. These landfills generally operated prior to rigorous environmental regulations and some were closed prior to current stricter requirements. Even at landfills that restricted the placement of contaminated materials, if excavation were to be required in these filled areas, the potential for contamination to be encountered is generally high.

Contaminated materials are known or likely to be present both within the right-of-way as well as in sites adjacent to or proximate to the right-of-way. Construction of the proposed project would involve some demolition, relocation or other disturbance of existing structures and excavation, disturbance, and likely removal for off-site disposal of some existing soil. Dewatering of groundwater would most likely also be required in specific locations, depending on the final determination of the types of foundations to be used for bridges, viaducts, and retaining walls, as well as the ultimate construction methods.

The presence of contaminated materials only presents a threat when exposure to these materials occurs. Even then a health risk requires both a complete exposure pathway to the contaminants and a sufficient dose to produce adverse health effects. The most likely route of exposure would be through breathing volatile/semi-volatile compounds or particulate-laden air released during demolition, excavation, and construction activities. Following construction of the proposed project, there would be no significant potential for continued exposure. In order to prevent such exposure pathways and doses, the proposed project would include appropriate health and safety and investigative/remedial measures (conducted in consultation with the appropriate regulatory authorities). These measures are discussed more fully below, but would include:

ASBESTOS-CONTAINING MATERIALS (ACM) MANAGEMENT PLAN

Proper handling, removal, and disposal of ACM is governed by both federal and state requirements. Appropriate engineering controls (e.g., wetting and other dust control measures) to minimize asbestos exposure would be implemented prior to and throughout the project.

LEAD-BASED PAINT (LBP) MANAGEMENT PLAN

If lead-coated surfaces are present, an exposure assessment would be performed to determine whether lead exposure would occur during construction of the project including demolition and/or removal of the existing Portal Bridge. If the exposure assessment were to indicate the potential to generate airborne dust or fumes with lead levels exceeding health-based standards, a higher personal protection equipment standard would be employed to counteract the exposure. In all cases, appropriate methods to control dust and air monitoring, as required by OSHA, would be implemented.

PCB-CONTAINING EQUIPMENT

Suspected PCB-containing equipment (e.g., transformers, electrical feeder cables, hydraulic equipment, and fluorescent light ballasts) that would require disturbance or relocation for construction of the proposed project would be surveyed and evaluated. PCB-containing equipment that would be disturbed by the work would be removed and disposed of in accordance with applicable federal and state regulations. Generally, unless suspected PCB-containing equipment is labeled to be "non-PCB," it must be tested or assumed to be PCB-containing and disposed of at properly licensed facilities.

CONSTRUCTION HEALTH AND SAFETY PLAN (CHASP)

Prior to commencing site disturbance, a Construction Health and Safety Plan (CHASP) would be prepared to address both the known contamination issues (based on the existing information) and contingency items (e.g., finding unexpected chromate contamination or petroleum storage tanks). The CHASP would describe in detail the health and safety procedures to minimize exposure of contaminated materials to workers and the public. The hazards would be evaluated by determining the known or suspected subsurface contaminants of concern and their chemical and physical characteristics, and health hazards would be considered within the potential exposure associated with the work to be performed. The CHASP would be developed in accordance with OSHA regulations and guidelines. The CHASP is expected to include designation and training of appropriate personnel, monitoring for the presence of contamination (e.g., buried tanks, drums or other containers, sludges; or soil which shows evidence of potential contamination, such as discoloration, staining, or odors) and appropriate response plans. To prevent the potential off-site transport of dust, dust control measures would be implemented as necessary during all earth-disturbing operations.

WASTE MANAGEMENT

The project documents would address procedures for stockpiling, testing, loading, transporting (including truck routes), and properly disposing of all excavated material requiring off-site disposal. Excavated material would be characterized to classify the material (e.g., as contaminated waste, petroleum-contaminated wastes, chromate-contaminated soils, historic fill containing construction and demolition debris, or uncontaminated native soils). The extent and parameters of this testing are dependent on the requirements of the waste disposal facilities, each of which may have different requirements for representative waste sampling and laboratory analysis prior to accepting material for disposal.

Wastes containing contaminated materials require special handling, storage, transportation, and disposal methods to prevent releases that could impact human health or the environment. Depending on the nature of the material, federal, state, and local regulations require the use of special containers or stockpiling practices for on-site storage of the material to prevent the release of contaminated materials to the environment. The federal, state, and local departments of transportation have requirements for transportation of wastes containing contaminated materials. Facilities that receive contaminated materials

require federal, state, and local permits to accept the waste, and generally require that specific representative waste sampling and laboratory analysis protocols be conducted prior to accepting material for disposal.

GROUNDWATER

Where dewatering is required, it is possible that the water would require treatment prior to its discharge to surface water or existing sewers. Prior to any such discharge, the water would be tested and discharge, whether to surface water or sewer, would only be conducted in accordance with applicable requirements including NPDES for discharge to surface water and local and state requirements for sewer discharge.

7:7E-3.42: EXCLUDED FEDERAL LANDS

Excluded Federal lands are those lands, the use of which is, by law, subject solely to the discretion of or held in trust by the Federal Government, its officers or agents. These lands are excluded from the coastal zone as required by Section 304 of the Federal Coastal Zone Management Act.

There are no excluded federal lands at the Portal Bridge Capacity Enhancement Project site. Therefore this rule is not applicable.

7:7E-3.43: SPECIAL URBAN AREAS

Special urban areas are those municipalities defined in urban aid legislation (N.J.S.A. 52:27D-178) qualified to receive State aid to enable them to maintain and upgrade municipal services and offset local property taxes. Under N.J.S.A. 52:27D-178 et seq., the Department of Community Affairs (DCA) establishes a list of qualifying municipalities each fiscal year. DCA's list of qualifying municipalities may be obtained on request from the Department's Land Use Regulation Program, PO Box 439, Trenton, New Jersey 08625-0439, (609) 292-0060.

Development that will help to restore the economic and social viability of special urban areas is encouraged. Development that would adversely affect the economic well being of these areas is discouraged when an alternative which is more beneficial to the special urban areas is feasible.

It is expected that one of the long term consequences of the proposed project will be enhanced connectivity with Manhattan for New Jersey urban areas including Newark, Secaucus, Kearny, and other municipalities. The safer and more reliable operation of the Northeast Corridor incrementally improves the economic and social viability of these areas through this enhanced connectivity with the areas economic and cultural center.

7:7E-3.44: PINELANDS NATIONAL RESERVE AND PINELANDS PROTECTION AREA

The Pinelands National Reserve includes those lands and water areas defined in the National Parks and Recreation Act of 1978, Section 502 (P.L. 95-625), an approximately 1,000,000 acre area ranging from Monmouth County in the north, south to Cape May County and from Gloucester and Camden County on the west to the barrier islands of Island Beach State Park and Brigantine Island along the Atlantic Ocean on the east (see Appendix, Figure 10, incorporated herein by reference). The "Pinelands Area" is a slightly smaller area within the Pinelands National Reserve. It was designated for State regulation by the Pinelands Protection Act of 1979 (N.J.S.A. 13:18-1 et seq.). The Pinelands Commission adopted a Comprehensive Management Plan in November, 1980. Within the Pinelands Area, the law delineates a Preservation Area, where the plan shall "preserve an extensive and contiguous area of land in its natural state, thereby insuring the continuation of a Pinelands environment ..." (Section 8c).

Portal Bridge Capacity Enhancement Project is not located in the Pinelands National Reserve or the Pinelands Protection Area. Therefore, this rule is not applicable.

7:7E-3.45: HACKENSACK MEADOWLANDS DISTRICT

The Hackensack Meadowlands Reclamation and Development Act of 1968 created the New Jersey Meadowlands Commission (NJMC), which manages the 19,730 acre area of water, coastal wetlands, and associated uplands of the Hackensack Meadowlands District. The NJMC acts as the lead coastal planning and management agency within this Special Area. The NJMC Master Plan Zoning Rules are adopted as part of the Coastal Management Program and the Hackensack Meadowlands District is designated a Geographic Area of Particular Concern. The department periodically reviews the Commissions actions. Coastal activities under the jurisdiction of the NJMC shall not require a Freshwater Wetlands permit, or be subject to transition area requirements of the Freshwater Wetlands Protection Act, except the discharge of dredged or fill materials which may require a permit.

The Portal Bridge Capacity Enhancement Project falls within the Hackensack Meadowlands District. As such, the build alternatives would require review by the NJMC, and all activities must comply with pertinent regulations as defined by the rule. The project fully intends to comply with NJMC regulatory and land use requirements.

7:7E-3.46: WILD AND SCENIC RIVER CORRIDORS

Wild and scenic river corridors are all rivers designated into the National Wild and Scenic Rivers System and any rivers or segments thereof being studied for possible designation into that system pursuant to the National Wild and Scenic Rivers Act (16 U.S.C. 1271-1278). For rivers designated into the national system, the wild and scenic river corridor shall include the river and adjacent areas located within one-quarter mile from the mean high water line on each side of the river until a Federal River Management Plan has been adopted, after which time the wild and scenic corridor shall be the area defined in the adopted plan. For rivers under study for possible designation into the national system, the wild and scenic river corridor shall include the river and adjacent areas extending one-quarter mile from the mean high water line on each side of the river.

The Hackensack River, in the project area, is not designated as a Wild and Scenic River. Therefore this rule is not applicable.

7:7E-3.47: GEODETIC CONTROL REFERENCE MARKS

Geodetic control reference marks (monuments, points, and rivets) are traverse stations and benchmarks established or used by the New Jersey Geodetic Control Survey. Overall, the disturbance of a geodetic control reference mark is discouraged. If these marks must be moved due to development, the New Jersey Geodetic Control Survey shall be contacted at least 60 days prior to disturbance.

At this point in the development process, the project remains in a conceptual design phase. Specific field investigations that would identify geodetic control reference marks have not been completed. These markers will be identified survey efforts completed to support preliminary and final engineering design. Full compliance with this policy will be a project requirement.

7:7E-3.48: HUDSON RIVER WATERFRONT AREA

"The Hudson River Waterfront Area" extends from the George Washington Bridge in Fort Lee, Bergen County to the Bayonne Bridge in Bayonne, Hudson County, inclusive of all land within the municipalities of Bayonne, Jersey City, Hoboken, Weehawken, West New York, Guttenberg, North Bergen, Edgewater and Fort Lee subject to the Waterfront Development Law.

The project is located on the Hackensack River. Therefore this rule is not applicable.

7:7E-3.49: ATLANTIC CITY

The area of Atlantic City is those lands within the municipal boundary of the City of Atlantic City. Atlantic City has many development rules associated with these types of development: casino hotel development,

development proposed on existing ocean piers, construction of new commercial piers or expansion of existing commercial piers, development proposed in the Boardwalk right-of-way, and development in the street rights-or-way (for further explanation, see rule).

The Portal Bridge Capacity Enhancement Project is not located in Atlantic City. Therefore, this rule is not applicable.

7:7E-3.50: LANDS AND WATERS SUBJECT TO PUBLIC TRUST RIGHTS

Lands and waters subject to public trust rights are tidal waterways and their shores, including both lands now or formerly below the mean high water line, and shores above the mean high water line. Tidal waterways and their shores are subject to the Public Trust Doctrine and are held in trust by the State for the benefit of all the people, allowing the public to fully enjoy these lands and waters for a variety of public uses. Development that adversely affects lands and waters subject to public trust rights is discouraged. Public access to lands and waters subject to public trust rights shall be provided in accordance with the public trust rights rule, N.J.A.C. 7:7E-8.11.

The proposed project will work collaboratively with NJDEP, Hudson County, Amtrak and other project stakeholders to provide safe and secure public access in accordance with this policy. The specific details of the public access location and design will depend upon considerations of public safety, railroad security, environmental impacts, and other potential effects.

USE RULES- GENERAL WATER AREAS

7:7E-4.2: AQUACULTURE

Aquaculture is the use of permanently inundated water areas, whether saline or fresh, for the purposes of growing and harvesting plants or animals in a way to promote more rapid growth, reduce predation, and increase harvest rate. Oyster farming in Delaware Bay is a form of aquaculture.

There is no aquaculture activities associated with the Portal Bridge Capacity Enhancement Project. Therefore, this rule is not applicable.

7:7E-4.3: BOAT RAMPS

Boat ramps are inclined planes, extending from the land into a water body for the purpose of launching a boat into the water until the water depth is sufficient to allow the boat to float. Boat ramps are most frequently constructed of asphalt, concrete or crushed shell.

There are no boat ramps proposed or impacted by the Portal Bridge Capacity Enhancement Project. Therefore this rule is not applicable.

7:7E-4.4: DOCKS AND PIERS FOR CARGO AND COMMERCIAL FISHERIES

Docks and piers for cargo and passenger movement and commercial fisheries are structures supported on pilings driven into the bottom substrate or floating on the water surface, used for loading and unloading passengers or cargo, including fluids, connected to or associated with, a single industrial or manufacturing facility or to commercial fishing facilities.

There are no docks or piers for cargo and passenger movement or commercial fisheries at the Portal Bridge Capacity Enhancement Project site. Therefore, this rule is not applicable.

7:7E-4.5: RECREATIONAL DOCKS AND PIERS

Recreational and fishing docks and piers are structures supported on pilings driven into the bottom substrate, or floating on the water surface or cantilevered over the water, which are used for recreational

fishing or for the mooring of boats or jet skis used for recreation or fishing, except for commercial fishing, and house boats.

There are no recreational docks or piers proposed or impacted by the Portal Bridge Capacity Enhancement Project. Therefore this rule is not applicable.

7:7E-4.6: MAINTENANCE DREDGING

Maintenance dredging is the removal of accumulated sediment from previously authorized and legally dredged navigation and access channels, marinas, lagoons, canals or boat moorings for the purpose of maintaining a previously authorized water depth and width for safe navigation.

Maintenance dredging is not proposed as part of the Portal Bridge Capacity Enhancement Project. Therefore, this rule is not applicable.

7:7E-4.7: NEW DREDGING

New dredging is the removal of sediment that does not meet the definition of maintenance dredging at N.J.A.C. 7:7E-4.6.

This project does not involve new dredging as defined by the rule; however, in-water project elements necessary to support the build alternatives such as bridge demolition and caisson drilling have the potential to require removal of some sediments or may result in temporary adverse impacts due to increases in suspended sediment.

As discussed under N.J.A.C. 7:7E-3.5 above, the project site would be strongly influenced by tidal currents. While measures such as silt curtains would be employed during in-water work, it is possible that some sediment may escape such controls. Any temporary sediment resuspension associated with pile driving or other construction activities would be localized to the project site. This sediment would be expected to dissipate shortly after the completion of the sediment disturbing activity and would not be expected to result in impacts to water quality or aquatic biota. Life stages of estuarine-dependent and anadromous fish species, bivalves and other macroinvertebrates generally are generally tolerant of elevated suspended sediment concentrations and have evolved behavioral and physiological mechanisms for dealing with variable concentrations of suspended sediment. The invertebrate species found in the Hackensack River are necessarily adapted to naturally turbid estuarine conditions and can tolerate short-term exposures by closing valves or reducing pumping activity. Mobile benthic invertebrates that occur in estuaries have been found to be tolerant of extremely elevated suspended sediment concentrations. In studies of the tolerance of crustaceans exposed to suspended sediments for up to two weeks, nearly all mortality was caused by the full-time exposure to high suspended sediment concentrations (greater than 10,000 mg/L), which would not occur from the in-water work associated with the proposed project (except perhaps extremely locally). Therefore, temporary increases in suspended sediment resulting from in-water construction activities would not be expected to result in significant adverse impacts to fish and mobile benthic macroinvertebrates.

7:7E-4.8: DREDGED MATERIAL DISPOSAL

Dredged material disposal is the discharge of sediments removed during dredging operations.

As discussed above under 7:7E-4.7, this project does not involve dredging as defined by the rule; however, if the removal of sediments for construction purposes becomes necessary, all removed materials will be disposed of in accordance with applicable state and federal regulations, and in compliance with the terms and conditions of all permits for the removal and disposition of these sediments. Because these sediments are likely to contain contaminants, they would be treated as hazardous materials as discussed under Policy N.J.A.C. 7:7E-3.41 (‘Special Hazard Areas’), N.J.A.C. 7:7E-8.22 (‘Solid and Hazardous Waste’), 7:7E-8.4 (‘Water Quality’), 7:7E-8.7 (‘Stormwater Management’), and other relevant regulations as appropriate.

7:7E-4.9: SOLID WASTE OR SLUDGE DUMPING

The dumping of solid waste or sludge is the discharge of solid or semi-solid waste material from industrial or domestic sources or sewage treatment operations into a water area. The dumping of solid or semi-solid waste of any type in any General Water Area is prohibited.

The existing in-water features (e.g. the current Portal Bridge spans and supports) will be removed by crane to barge and/or shore-based vehicles and treated in accordance with applicable state and federal regulations regarding the disposal of solid wastes.

7:7E-4.10: FILLING

Filling is the deposition of material including, but not limited to, sand, soil, earth, and dredged material, into water areas for the purpose of raising water bottom elevations to create land areas.

This project does not involve filling for the purposes of raising water bottom elevations to create land areas. The project acknowledges that project elements (e.g. piles and caissons) constitute fill in the sense that they occupy volume within the regulated resource (i.e., a water area), but do not constitute fill as defined in this Rule. Fill in wetlands is discussed under N.J.A.C. 7:7E-3-27 above.

7:7E-4.11: MOORING

A boat mooring is a temporary or permanently fixed or floating anchored facility in a water body for the purpose of attaching a boat. Temporary or permanent boat mooring areas are conditionally acceptable provided that there is a demonstrated need that cannot be satisfied by existing facilities; adverse environmental impacts are minimized to the maximum extent practicable; and the mooring area is adequately marked and is located so as not to hinder navigation. A hazard to navigation will apply to all potential impediments to navigation, including access to adjacent moorings, water areas, docks and piers.

It is expected that some construction activity associated with the proposed project will be conducted from a barge or barges temporarily moored in the tidal Hackensack River. The barges are necessary to deliver and handle the large bridge spans needed for the project. The mooring area will be marked in accordance with USCG requirements for moored construction vessels. Specific locations for moorings will be developed and permitted as part of the construction plan completion.

7:7E-4.12: SAND AND GRAVEL MINING

Sand and gravel mining is the removal of sand or gravel from the water bottom substrate, usually by suction dredge, for the purpose of using the sand or gravel at another location.

The proposed project does not involve sand and gravel mining. Therefore, this rule is not applicable.

7:7E-4.13: BRIDGES

A bridge is any continuous structure spanning a water body, except for an overhead transmission line. Bridges are conditionally acceptable provided:

1. There is a demonstrated need that cannot be satisfied by existing facilities;

2. Pedestrian and bicycle use is provided for unless it is demonstrated to be inappropriate; and

3. Fishing catwalks and platforms are provided to the maximum extent practicable.

This shall be taken into consideration during the design phase of all proposed bridge projects.

The Northeast Corridor is the most heavily used passenger rail line in the U.S., both in terms of ridership and service frequency.[36] The Northeast Corridor extends from Washington, D.C. in the south to Boston, MA in the north, serving the densely populated northeast region, including Pennsylvania Station in New York City (PSNY). Amtrak, the nationwide inter-city passenger rail operator, owns much of and operates over all of the Northeast Corridor. Amtrak operates regional service, long distance service, and high-speed Acela Express service along the line. Several commuter rail agencies provide local and semi-express regional passenger services along the Northeast Corridor.

Amtrak provides service to over 500 destinations in 46 states on 21,000 miles of routes. Amtrak owns and operates the Northeast Corridor from PSNY in New York City to Washington D.C., including the above-referenced "High Line" connecting Newark, New Jersey and New York, New York. An average of over 69,000 passengers travel on up to 300 Amtrak trains per day across the nation. Amtrak carries approximately 24,000 intercity passengers per day between New York and Washington, D.C.

NJ TRANSIT, New Jersey's public transportation corporation, provides bus, rail, and light rail transit throughout the state. NJ TRANSIT is the nation's largest statewide public transportation system, providing bus, rail, and light rail services that connect major points in New Jersey, New York, and Pennsylvania. Over 800,000 daily trips are provided on NJ TRANSIT's 238 bus routes, 11 commuter rail lines, and 3 light rail lines. NJ TRANSIT's Northeast Corridor Line operates over Amtrak's Northeast Corridor in portions of Pennsylvania, New Jersey, and New York from Trenton to PSNY. Several of NJ TRANSIT's other commuter rail lines join Amtrak's Northeast Corridor west of the Hackensack River and subsequently travel under the Hudson River to their terminus at PSNY.

Amtrak's Northeast Corridor and NJ TRANSIT's commuter rail system helps drive the region's economic growth by connecting the regions of Washington, D.C., Baltimore, Wilmington, Philadelphia, and New Jersey with New York City. This includes the growing west-of-Hudson residential communities throughout New Jersey, Orange and Rockland Counties in New York, and portions of Pennsylvania. Amtrak carries approximately 15,700 passengers each day in each direction over the Portal Bridge (roughly 30,000 in both directions), including 3,900 passengers per day on the time-sensitive premium Acela Express service. NJ TRANSIT carries an average of 150,000 passengers per day in both directions over the Portal Bridge on approximately 350 trains.[37] Approximately 270,000 people commute into Manhattan from points west of the Hudson River in areas served by NJ TRANSIT's commuter trains, and an estimated 21 percent of these commuters use rail as the primary means of entering New York City3. This number has grown by 64 percent since 1980. The North Jersey Transportation Planning Authority (NJTPA) projects the population of northern New Jersey will grow more than 16 percent by 2025, to 7.6 million people. Most of this growth is expected in the southernmost and westernmost counties, including Ocean, Sussex, and Warren Counties. The commuter rail system will need to meet increased demands from this population growth.

Currently, many of NJ TRANSIT's rail commuters and all Amtrak Northeast Corridor passengers en route to or from Manhattan and points south travel over the Portal Bridge. Four of NJ TRANSIT's rail lines—the Northeast Corridor Line, the North Jersey Coast Line, certain Montclair-Boonton Line trains, and certain Morris & Essex Line (which includes the Gladstone Branch and Morristown Line) trains—utilize the Portal Bridge. Amtrak currently operates approximately 100 weekday scheduled trains in both directions over this segment of the Northeast Corridor. Amtrak's Northeast Corridor operations, which connect Washington, D.C., New York City, and Boston, are considered among the most financially viable of all its routes around the country, and service along this corridor has consistently been regarded as

---

[36] Source: BGL Rail Associates, for the Amtrak Reform Council, *A Recommended Approach to Funding the Estimated Capital Investment Needs of the Northeast Corridor Rail Infrastructure*, April 2002.

[37] The approximately 350 trains does not include non-revenue movements, which increase the total number of trains NJ TRANSIT operates over the Portal Bridge per day to approximately 370.

essential by each state through which it operates and by Congress. Amtrak receives approximately $1.5 million per day from passengers traveling on trains over the Portal Bridge, which is approximately one-third of Amtrak's total passenger related revenue.

Due to capacity constraints and higher demand, the ratio of passengers to trains is greater for those trains operating over the Portal Bridge than for those trains on other lines which do not operate over the Portal Bridge. Twenty NJ TRANSIT trains operating over the Portal Bridge serve 17,700 passengers while 13,600 passengers on other lines are served by 29 trains that do not operate over the bridge. Over the past few decades, improvements to the Northeast Corridor's infrastructure have greatly enhanced rail operations for Amtrak and NJ TRANSIT. Other planned projects intended to meet future transportation demands will place additional importance on a reliable and efficient Hackensack River crossing.

The existing Portal Bridge was constructed nearly a century ago. Design standards for steel railroad bridges anticipate a typical lifespan of 100 years. Given the Portal Bridge's age, the structure is nearing the end of its economic life. Structural integrity and passenger safety are top priorities for both Amtrak and NJ TRANSIT. One of Amtrak's stated goals in its Strategic Reform Initiatives and FY06 Grant Requests (April 2005) is the return of the Northeast Corridor infrastructure to a "state of good repair and operational reliability." NJ TRANSIT also strives to maintain the infrastructure in a "state of good repair," which is achieved when infrastructure components are replaced on a schedule consistent with their life expectancy. The existing Portal Bridge presents a considerable ongoing operation and maintenance expense for Amtrak because the mechanical and structural components are prone to failure due to age and wear.

In addition to the age of the Portal Bridge, several aspects of the bridge's design are problematic. The bridge consists of seven spans and totals 961 feet in length. The middle span is a 300-foot long moveable swing-span and is able to pivot to an open position (perpendicular to the rail line) to allow marine traffic to pass through the bridge. When the swing-span is open, the bridge is closed to train traffic. Special rail connections, known as "miter rails," allow the rails to disengage and the bridge to open and close. These connections are mechanically separated and automatically controlled for the swing-span to open and then are realigned after it is closed. Mechanical wedges must lock the structure in the closed position and. After being locked in place, special mechanical catenary connections must join the continuous contact wire on either end of the bridge to rejoin the electric traction connection. Depending on the reliability of this process, the period of time the bridge is closed to train traffic may be extended, resulting in train delays. Due to these issues, older swing-span bridges are now being replaced by other types of moveable bridges such as vertical lift and single-span bascule bridges. The miter rail connections have been an ongoing problem since the Portal Bridge was constructed, and the connections have been replaced several times. They are vulnerable to maladjustment and negatively affected by temperature changes. The rate of wear on these miter rail connections is worsened with higher train speeds and frequencies. As a result, while trains can operate at 90 miles per hour (mph) on adjacent portions of the Northeast Corridor, speeds on the Portal Bridge were previously been restricted to 70 mph, and most recently (December 2006) have been permanently restricted to 60 mph.

The bridge openings required to accommodate marine traffic increase the likelihood of mechanical malfunctions, which have in the past caused the bridge to remain in the open position for long periods of time. An evaluation of bridge openings and closure malfunctions was performed for the period between 2000 and 2006. During this time period, 274 bridge openings were recorded. These included openings to test the bridge as well as for marine traffic. These openings ranged in duration from 1 minute to 93 minutes, and the average time required was 15 minutes per opening.

Between 1995 and 2006, the number of days between trouble reports or failures has steadily decreased—indicating that issues with bridge operations have become more chronic over time. Additionally, the failure minutes per day (a metric that measures both the frequency of trouble reports and the amount of time required to correct the problem) ranged from 0 minutes per day to a maximum of 1,943 minutes per

day, with an average of 50.3 minutes per day. Although in some cases these failures reflect situations where the Portal Bridge was unable to open for marine traffic, the majority of these failures reflect instances where the bridge was opened and unable to close, thereby restricting train traffic. It should also be noted that the bridge is sometimes immediately closed for repair once a problem is identified, in which cases marine traffic is restricted. The aging and limiting infrastructure is clearly problematic for both rail and marine traffic.

The two-track configuration of the Portal Bridge and the speed restrictions discussed above limit the number of trains that can cross the Hackensack River, which is especially problematic during peak commuter hours. Recent system enhancements, such as the implementation of NJ TRANSIT's MidTOWN Direct service (which allows a limited number of Morris & Essex Line trains and Montclair-Boonton Line trains to merge onto the Northeast Corridor west of Portal Bridge for direct access to Midtown Manhattan) have increased the total number of daily trains traveling over this already congested section of rail line.

The Northeast Corridor has two tracks between Swift Interlocking (the point where MidTOWN Direct trains merge onto the Northeast Corridor) and Secaucus Transfer Station (the point where six NJ TRANSIT lines intersect). Typically, one track operates eastbound and one track operates westbound. This current configuration creates two bottlenecks. Eastbound trains must merge from two tracks to one track at Swift Interlocking, and westbound trains must merge from two tracks to one track leaving Secaucus Transfer Station. Because multiple rail lines and different train types operated by NJ TRANSIT and Amtrak are merging onto a two-track bridge crossing, the window of opportunity for each train is reduced. This operational inflexibility means that a delay on one rail line can cascade to other rail lines. For example, if a Northeast Corridor Line train is delayed, a MidTOWN Direct train on the Montclair-Boonton Line may be forced to miss its appointed time to pass through Swift Interlocking and over the Portal Bridge. Similarly, if an eastbound North Jersey Coast Line train is stalled on or near the Portal Bridge, other eastbound trains on the Morris & Essex, Montclair-Boonton, and Northeast Corridor Lines may be delayed. Likewise, delays to a NJ TRANSIT train may delay Amtrak trains and vice versa.

A recent analysis (January 2006) of train delays between Swift Interlocking and Secaucus Transfer Station was conducted over a two-week period. The analysis revealed that on seven out of ten weekdays, at least one peak period train was delayed due to the merge at Swift Interlocking. On average, an additional four to five trains were subsequently delayed due to the initial interruption to service. Frequent bridge openings exacerbate the current operational inflexibility. Bridge openings must be scheduled during certain time periods, during which trains cannot operate over the Portal Bridge. Since several rail lines use the bridge, mechanical malfunctions during bridge closings cause a ripple effect throughout the corridor.

The existing bridge also complicates maritime traffic using the Hackensack River, a navigable waterway governed by the USCG. The existing Portal Bridge has only 23 feet of clearance between MHW and the lowest steel elevation of the bridge. As a result, marine traffic along this segment of the Hackensack River requires the frequent opening of the Portal Bridge and disruption of Northeast Corridor train traffic. Bridge opening logs show that between 2004 and 2006, there were 663 bridge openings for marine traffic. This conflict is currently managed by restricting the times during which the bridge is permitted to open. Under current federal regulations, the bridge need not be opened Monday through Friday, except federal holidays, from 6:00 AM to 10:00 AM and from 4:00 PM to 8:00 PM. However, additional bridge openings shall be provided for commercial vessels from 6:00 AM to 7:20 AM; 9:20 AM to 10 AM; 4 PM to 4:30 PM and from 6:50 PM to 8:00 PM; if at least one-hour advance notice is given by calling the number posted at the bridge. In spite of these restrictions, both NJ TRANSIT and Amtrak's service is still affected by bridge openings due to marine traffic. An almost equal number of trains operate during the period when openings are not limited as operate during the period when opening are limited.

Additionally, bridge malfunctions cause delays that cascade from the non-peak period into the peak period. As the most heavily traveled rail line in the U.S., trains are rigidly scheduled going into and out of New York City. Delays to rail traffic (even those as short as 15 minutes) can cause trains to fall behind schedule, affecting trains behind it and creating a cascading delay effect. Depending on the length of delay, those which occur during the less-sensitive off-peak hours last into the peak hour and affect Amtrak and NJ TRANSIT's most frequent riders.

Just as the Portal Bridge can be stuck in the open position, obstructing the passage of trains, it can also be stuck in the closed position, obstructing the passage of boats and barges. Additional delays to mariners can occur if they arrive during the time-period when bridge openings are restricted, or if the period when the bridge can be opened does not correspond to the required tide.

The need for the proposed project is clear and well documented, and viable or less impactful alternatives for addressing the strategic bottleneck caused by the Portal Bridge by relocating the project do not exist. As discussed elsewhere in this assessment, to the extent safely practicable, mitigative strategies have been incorporated into the design of the project (e.g. elevated structure in wetlands instead of fill) to minimize the impacts of the proposed project. Where mitigative measures could not be incorporated into project design, mitigation strategies are planned to offset impacts in accordance with applicable regulations. For example, due to safety and security concerns associated with high-speed rail traffic on the bridge and the height of the proposed spans above the tidal river, the structures cannot accommodate public access for pedestrians, bicycles, or fishing. However, the such access will be provided as appropriate in accordance with N.J.A.C. 7:7E-3.50 ('Lands and Waters Subject to Public Trust Rights') and N.J.A.C. 7:7E ('Public Trust Rights').

7:7E-4.14: SUBMERGED PIPELINES

Submerged pipelines (pipelines) are underwater pipelines which transmit liquids or gas, including crude oil, natural gas, water petroleum products or sewerage.

The Portal Bridge Capacity Enhancement Project does not include the construction or alteration of any submerged pipelines. Therefore, this rule is not applicable.

7:7E-4.15: OVERHEAD TRANSMISSION LINES

Overhead transmission lines are wires hung between supporting pylons for transmission from the site of origin to the site of consumption. Overhead transmission lines include electrical, telecommunication and cable television lines. Overhead transmission lines are prohibited over open bays, semi-enclosed and back bays, lakes, ponds and reservoirs as defined at N.J.A.C. 7:7E-4.1. Overhead transmission lines are discouraged over large rivers as defined at N.J.A.C. 7:7E-4.1. Overhead transmission lines are conditionally acceptable over rivers, streams, creeks, and tidal guts as defined at N.J.A.C. 7:7E-4.1, provided:

1. There is a demonstrated need that cannot be satisfied by existing facilities;

2. There is no feasible alternative route that avoids crossing water bodies;

3. The transmission line provides adequate vertical clearance for masts; and

4. Visual impacts are minimized to the maximum extent practicable.

The Portal Bridge Capacity Enhancement Project involves overhead electrical lines that supply electricity to the catenary of electrically powered locomotives. This need cannot be provided by existing facilities, and there are no feasible alternatives to this route because of the need for it to integrate into the existing regional rail system. The overhead electrical system would comprise part of the bridge superstructure, and would occur within the footprints of the proposed alignments. As such, they will provide ample vertical clearance for masts.

7:7E-4.16: DAMS AND IMPOUNDMENTS

Dams and impoundments are structures that obstruct natural water flow patterns for the purpose of forming a contained volume of water. Impoundments include dikes with sluice gates and other structures to control the flow of water.

Although the proposed project involves the construction of spans across existing areas of impounded water, the project does not involve any new dams or impoundments. Impounded areas include the "Kearny Brackish Marsh" – a formerly vegetated tidal wetland now impounded as open waters by means of a perimeter dike and water control structure on the Hackensack River. Similarly, the area known as the Cedar Creek Marsh is essentially impounded by existing infrastructure (e.g. the Newark Turnpike, NJ TRANSIT rail lines) that regulate water levels via sluice gates, culverts, or other water control structures. The proposed project involves crossing these features with spans supported by piles or caissons; however, the proposed project does not involve the creation or expansion of impounded areas. Therefore, this policy is not applicable.

7:7E-4.17: OUTFALLS AND INTAKES

Outfalls and intakes are pipe openings that are located in water areas for the purpose of intake of water or discharge of effluent including sewage, stormwater and industrial effluents. Outfalls and intakes are conditionally acceptable provided that the use associated with the intake or outfall meets applicable Coastal Zone Management rules.

All construction activities will be conducted in accordance with applicable water quality regulations as defined in this rule. All stormwater outfalls and associated appurtenances will be designed in accordance with best management practices (BMPs), Surface Water Quality Standards (N.J.A.C. 7:9-4), the rules concerning Wastewater Discharge Requirements (N.J.A.C. 7:9-5), the Ground-Water Quality Standards (N.J.A.C. 7:9-6), the Regulations Concerning the New Jersey Pollutant Discharge Elimination System (N.J.A.C. 7:14A), and in accordance with N.J.A.C. 7:7E-4.17 discussed above and N.J.A.C. 7:7E-8.7 below.

7:7E-4.18: REALIGNMENT OF WATER AREAS

Realignment of water areas means the physical alteration or relocation of the surface configuration of any water area. This does not include the rebulkheading of a previously bulkheaded water area or the bulkheading at or above the spring high water line.

The proposed project is not intended to realign any water area. With respect to in-water components, the two new Hackensack River bridges and several of the structures needed to traverse existing roads and rail rights-of-way would require the installation of caissons and/or piles in wetland and open water areas, along with embankments and retaining walls. The removal of the existing Portal Bridge and associated piers, piles, and fenders would be removed to or below the mudline, including the large, central pier located mid-channel and the adjacent piers supporting the central spans. The removal of these piers will increase the effective width of the bridge with respect to navigation, but would not result in any changes to the alignment of the water areas, including the main navigation channel. Therefore, this policy is not applicable.

7:7E-4.19: BREAKWATERS

Breakwaters, including, but not limited to, those constructed of concrete, rubble mound and timber, are structures designed to protect shoreline areas or boat moorings by intercepting waves and reducing the wave energy which would normally impact the adjacent shoreline areas or boat mooring areas. Typically, timber breakwaters are designed and utilized to protect boat moorings. In most cases concrete or rubble mound breakwaters are designed and utilized to protect shoreline areas which are subject to storm waves and associated erosion.

The project does not anticipate the use of breakwaters for the purposes of protecting shoreline areas or boat moorings as defined by this rule; however, the project does include in-water elements such as piers and caissons. These project elements are not for the purposes of wave energy dissipation; therefore, this rule is not applicable.

7:7E-4.20: SUBMERGED CABLES

Submerged cables (cables) are underwater telecommunication cables, and shall include all associated structures in the water such as repeaters.

Although Portal Bridge Capacity Enhancement Project involves the abandonment in place of an existing electrical cable (discussed under Policy 7:7E-3.12, Submerged Infrastructure Routes), the project does not involve the installation of telecommunication cables. Therefore, this rule is not applicable.

7:7E-4.21: ARTIFICIAL REEFS

Artificial Reefs are man-made structures intended to simulate the characteristics and functions of natural reefs created by placing hard structures on the sea-floor for the purpose of enhancing fish habitat and/or fisheries.

The Portal Bridge Capacity Enhancement Project does not propose the construction or alteration of any artificial reefs. Therefore, this rule is not applicable.

7:7E-4.22: MISCELLANEOUS USES

Miscellaneous uses are uses of Water Areas not specifically defined in N.J.A.C. 7:7E-4 or addressed in the Use rules (N.J.A.C. 7:7E-7)

The proposed project involves uses specifically defined in N.J.A.C. 7:7E-4 and addressed in N.J.A.C. 7:7E-7. Therefore, this rule is not applicable.

REQUIREMENTS FOR IMPERVIOUS COVER AND VEGETATIVE COVER FOR GENERAL LAND AREAS AND CERTAIN SPECIAL AREAS

If a site is located in the Hackensack Meadowlands District, as defined under N.J.S.A. 13:17-1 et seq., the Department shall not apply the requirements in N.J.A.C. 7:7E-5 and 5A, but shall apply the requirements for that area set forth at N.J.A.C. 7:7E- 3.45. The proposed project is located within the Hackensack Meadowlands District. Therefore, N.J.A.C. 7:7E-5 is not applicable.

GENERAL LOCATION RULES

7:7E-6.1: RULE ON LOCATION OF LINEAR DEVELOPMENT

A linear development as defined at N.J.A.C. 7:7E-1.8, shall comply with the specific location rules to determine the most acceptable route, to the maximum extent practicable. If part of the proposed alignment of a linear development is found to be unacceptable under the specific location rules, that alignment (perhaps not the least possible distance) may nonetheless be acceptable, provided the following conditions are met:

1. There is no prudent or feasible alternative alignment which would have less impact on sensitive areas and marine fish or fisheries as defined at N.J.A.C. 7:7E-8.2;

2. There will be no permanent or long-term loss of unique or irreplaceable areas;

3. Appropriate measures will be used to mitigate adverse environmental impacts to the maximum extent feasible, such as restoration of disturbed vegetation, habitats, and land and water features; and

4. The alignment is located on or in existing transportation corridors and alignments, to the maximum extent practicable.

The proposed project is a linear development. This rule may be applicable for some project elements. As discussed above under N.J.A.C. 7:7E-4.13 ('Bridges'), no reasonable alternative alignments would have less impact, because the project's alignment must integrate with existing rail infrastructure. There will be no permanent or long-term loss of unique or irreplaceable areas, as addressed under the discussion of policies under N.J.A.C. 7:7E-3.2 et. seq. above, and any impacts to natural resources will be mitigated in accordance with an NJDEP-approved mitigation plan. To the extent safely practicable, mitigative strategies have been incorporated into the design of the project (e.g. elevated structure in wetlands instead of fill) to minimize these impacts. Lastly, the alignment is located on an existing transportation corridor and alignment, to the maximum extent practicable.

7:7E-6.2: BASIC LOCATION RULE

A location may be acceptable for development under N.J.A.C. 7:7E-3, 4, 5, 5A, 5B, and 6, but the Department may reject or conditionally approve the proposed development of the location as reasonably necessary to:

1. Promote the public health, safety, and welfare;

2. Protect public and private property, wildlife and marine fisheries; and

3. Preserve, protect and enhance the natural environment.

As discussed throughout this assessment (e.g. under N.J.A.C. 7:7E-4.13 - 'Bridges', and under the Policies of N.J.A.C. 7:7E-3 regarding special areas), the proposed project is designed to enhance public safety and welfare by replacing an aging bridge and by increasing regional rail capacity to accommodate present uses and future population growth. The location of the proposed project is critical, because the Hackensack River crossing must integrate with existing railroad infrastructure. To the extent safely practicable, the project was designed to protect public and private property, wildlife, and marine fisheries, as well as other natural resources such as wetlands and subtidal shallows, through design elements (e.g. elevated structure over wetland areas versus fill). For impacts not mitigated by design, NJ TRANSIT intends to mitigate these impacts through mitigation plans approved by appropriate project stakeholders, including NJDEP.

7:7E-6.3: SECONDARY IMPACTS

Secondary impacts are the effects of additional development likely to be constructed as a result of the approval of a particular proposal. Secondary impacts can also include traffic increases, increased recreational demand and any other offsite impacts generated by onsite activities which affect the site and surrounding region.

An important goal of the Portal Bridge Capacity Enhancement Project is to improve reliability and provide additional rail capacity over the Hackensack River to allow enhanced Amtrak and NJ TRANSIT operations. This would lead to beneficial indirect effects including: sustained regional economic growth, more efficient transportation systems, and a reduction in automobile vehicle miles traveled (VMT), resulting in regional benefits to vehicular traffic and air quality. While the Portal Bridge Capacity Enhancement Project does not by itself result in additional train service to PSNY, it would allow future projects (such as the Access to the Region's Core project) to do so by expanding Hackensack River capacity. Therefore, the Portal Bridge Capacity Enhancement Project would indirectly lead to a greater reduction in regional auto VMT, as rail ridership increases in response to increased rail service from the 2030 Operating Plan and the ARC project. These indirect effects would be negligible in the absence of additional rail service across the Hudson River and into New York City.

The Portal Bridge Capacity Enhancement Project would, as an independent project, improve service and reliability. This enhanced rail service would indirectly result in some adverse transportation effects by improving service that could induce greater ridership and therefore additional demand on local transportation services in the vicinity of PSNY. These effects would include increased vehicular and pedestrian traffic on the streets surrounding PSNY as well as an increase in transfers to New York City Transit (NYCT) subway lines serving the station.

The build alternatives would result in beneficial secondary effects including sustained regional economic growth, an increase in regional mobility, and a reduction in automobile use. Since the project would relieve a critical bottleneck on a well-established rail corridor, rather than develop a new rail corridor, the potential for induced growth-related effects is small. Most of the area served by the existing rail network is already highly developed. Future development is planned within some parts of the indirect effects study area; however, the project would be supportive of that development but would not cause it.

The additional train service would lead to an increase in the number of passengers using NJ TRANSIT and Amtrak service, thereby decreasing the number of vehicle trips into New York City from the west. This would result in a reduction of VMT in the region (both in New York and New Jersey) and translate into a beneficial effect on the region's roadways, including wear and tear. It would also lead to a reduction in the level of congestion and travel times throughout the region, particularly during the commuter peak periods. Furthermore, the reduction in VMT on the region's expressways and river crossings would contribute to enhanced mobility throughout the metropolitan area, thereby supporting the existing and continuing trend of economic growth in the region.

The additional train service would lead to increases in passenger demand at stations throughout northern and central New Jersey. This would lead to localized increases in traffic and parking demand as ridership at individual stations increased over time. The specific locations of increased station access activity would change as the operating plan is implemented and adjusted to respond to changes in land use and development patterns, demographics or customer preferences. The potential adverse effects on parking and traffic would be assessed as part of NJ TRANSIT's ongoing Station Access Program. The program consists of various proactive measures which are intended to manage potential adverse indirect impacts on local transportation systems resulting from changes in service and increased ridership. Potential measures include: additional station parking; parking expansion at intercept locations; development of new stations to distribute ridership; community-based shuttle bus service; bicycle and pedestrian access improvements; and implementation of Smart Growth/Transit-Oriented Development in various communities.

USE RULES

7:7E-7.2: HOUSING USE RULES

Housing includes single family detached houses, multi-family units with apartments or town houses, high-rise buildings and mixed use developments.

No housing is proposed or impacted by the Portal Bridge Capacity Enhancement Project. Therefore, this rule is not applicable.

7:7E-7.3: RESORT/RECREATIONAL USE

Resort/recreation uses include the wide range of small and large developments attracted to and often dependent upon locations along the coast. These uses include hotels, motels, marinas, boating facilities, campgrounds, amusement piers, parks and recreational structures such as bathhouses, natural areas, open space for active and passive recreation, and linear paths for bicycling and jogging.

No resort/recreational use is proposed or impacted by the Portal Bridge Capacity Enhancement Project. Therefore, this rule is not applicable.

7:7E-7.4: ENERGY FACILITY USE RULE

Energy facilities include facilities, plants or operations for the production, conversion, exploration, development, distribution, extraction, processing, or storage of energy or fossil fuels. Energy facilities also include onshore support bases and marine terminals.

No energy facility use is proposed or impacted by the Portal Bridge Capacity Enhancement Project. Therefore, this rule is not applicable.

7:7E-7.5: TRANSPORTATION USE RULE

Standards relevant to public transportation are as follows:

1. New and improved public transportation facilities, including bus, rail, air, boat travel, people mover systems and related parking facilities, are encouraged.

2. Development of existing rights-of-way which would preclude either their use for public transportation or public recreation trails is discouraged.

The existing Portal Bridge is a two-track, moveable swing-span bridge that was constructed by the Pennsylvania Railroad (PRR) and began operation in 1910. The aging Portal Bridge, owned by Amtrak, is a bottleneck along the Northeast Corridor that conflicts with marine traffic and impedes efficient and reliable passenger rail service. The Northeast Corridor is the most heavily used passenger rail line in the U.S., both in terms of ridership and service frequency. The Northeast Corridor extends from Washington, D.C. in the south to Boston, MA in the north, serving the densely populated northeast region, including Pennsylvania Station in New York City (PSNY). Amtrak, the nationwide inter-city passenger rail operator, owns much of and operates over all of the Northeast Corridor. Amtrak carries approximately 15,700 passengers each day in each direction over the Portal Bridge, including 3,900 passengers per day on the time-sensitive premium Acela Express service. NJ TRANSIT carries an average of 150,000 passengers per day in both directions over the Portal Bridge on almost 350 trains (not including non-revenue trains that are not available to the public for transportation).

The Portal Bridge is a critical infrastructure element for Amtrak and NJ TRANSIT, enabling movement between destinations east and west of the Hudson River. The existing Portal Bridge, however, poses reliability concerns, capacity constraints, and operational inflexibility. The purpose of the project is to replace the nearly 100-year-old Portal Bridge and eliminate capacity constraints on the Northeast Corridor between Swift Interlocking and Secaucus Transfer Station.

The existing Portal Bridge was constructed nearly a century ago. Given the Portal Bridge's age, the structure is nearing the end of its economic life. The existing Portal Bridge presents a considerable ongoing operation and maintenance expense for Amtrak because the mechanical and structural components are prone to failure due to age and wear.

In addition to the age of the Portal Bridge, several aspects of the bridge's design are problematic. The middle span is a 300-foot-long moveable swing-span and is able to pivot to an open position to allow marine traffic to pass. When the swing-span is open, the bridge is closed to train traffic. Special rail connections, known as "miter rails," allow the rails to disengage and the bridge to open and close. The miter rail connections have been an ongoing problem since the Portal Bridge was constructed, and the connections have been replaced several times. While trains can operate at 90 miles per hour (mph) on adjacent portions of the Northeast Corridor, speeds on the Portal Bridge have been permanently restricted to 60 mph. The bridge openings required to accommodate marine traffic increase the likelihood of mechanical malfunctions, which have in the past caused the bridge to remain in the open position for long periods of time. Between 1995 and 2006, the number of days between trouble reports or failures has steadily decreased—indicating that issues with bridge operations have become more chronic over time.

The two-track configuration of the Portal Bridge and the speed restrictions discussed above limit the number of trains that can cross the Hackensack River, which is especially problematic during peak commuter hours. The Northeast Corridor has two tracks between Swift Interlocking (the point where MidTOWN Direct trains that diverge off of the Morris & Essex Line tracks merge onto the Northeast Corridor) and Secaucus Transfer Station. Because multiple rail lines and different train types operated by NJ TRANSIT and Amtrak are merging onto a two-track bridge crossing, the window of opportunity for each train is reduced. This operational inflexibility means that a delay on one rail line can cascade to other rail lines. A January 2006 analysis revealed that on average, an additional four to five trains were subsequently delayed due to an initial interruption in service. Frequent bridge openings exacerbate the current operational inflexibility.

The complexity of the swing bridge with the miter rail configuration and the level of train traffic requires vigilant maintenance and inspection of the Portal Bridge, especially the connections between the bridge and adjacent track. The current level of train traffic over the bridge leaves few windows of opportunity for maintenance and inspection activities to be performed. Sections of track must be taken offline to perform these tasks. To avoid disruption to passenger service, Amtrak is forced to conduct maintenance and inspection during increasingly limited time periods, such as at night and on weekends. This results in high costs from increased labor premiums for night and weekend work, and reduced productivity rates due to the small work windows. Often, if a component fails during the day, trains are forced to operate slower than usual through peak period operations until the following night when a section of track can be removed from service.

The existing Portal Bridge has only 23 feet of clearance between mean-high-water (MHW) and the lowest steel elevation of the bridge. As a result, the Portal Bridge is opened frequently to accommodate individual marine vessels, thereby disrupting Northeast Corridor train traffic. To assess the existing marine traffic, Portal Bridge data logs from April 2004 to April 2006 were examined. During that two-year period, there were 663 bridge openings. The average vertical clearance needed for those vessels that required a bridge opening was 27 feet. The smallest vertical clearance required by a particular vessel was 18 feet and the greatest vertical clearance required was 49 feet. This conflict is currently managed by restricting the times during which the bridge is permitted to open. Additionally, bridge malfunctions causes delays that cascade from the non-peak period into the peak period. As the most heavily traveled rail line in the U.S., trains are rigidly scheduled going into and out of New York City. Delays to rail traffic (even those as short as 15 minutes) can cause trains to fall behind schedule, affecting trains behind it and creating a cascading delay effect.

Accordingly, the project is designed to operationally accomplish the following goals:

GOAL 1: Enhance capacity to meet current and future demand—including new service—along the Northeast Corridor.

- Reduce the total number of locations between Swift and Allied Interlockings where trains must merge;
- Provide sufficient capacity to maintain adequate passenger rail service, prevent future overcrowding, and accommodate emerging markets for commuter and intercity rail passenger service; and
- Prevent future overcrowding of passenger rail trains.

GOAL 2: Improve service reliability and operational flexibility.

- Upgrade the nearly century-old moveable bridge to a state-of-good-repair or replace the structure; and
- Reduce the vulnerability of the existing capacity-constrained rail infrastructure to unexpected train delays, including weather-related incidents, breakdowns, and unusual travel demand.

GOAL 3: Provide a redundant Hackensack River crossing to facilitate maintenance and enhance passenger safety and security.

- Construct additional tracks to allow for continued rail operations during off-peak maintenance periods; and
- Provide a secondary crossing to enable continued rail operations in the event of an unplanned closure.

GOAL 4: Minimize conflicts with maritime traffic.

- Avoid or minimize disruptions to marine traffic during construction, while maintaining uninterrupted service to rail traffic;
- Minimize delays to trains or marine vessels due to bridge operations; and
- Provide sufficient vertical and horizontal clearance for larger marine vessels.

7:7E-7.6: PUBLIC FACILITY USE RULE

Public facilities include a broad range of public works for production, transfer, transmission, and recovery of water, sewerage and other utilities. The presence of an adequate infrastructure makes possible future development and responds to the needs created by present development.

The Portal Bridge Capacity Enhancement Project does not meet the definition of a public use. Therefore, this rule is not applicable.

7:7E-7.7: INDUSTRY USE RULE

Industry uses are uses that involve industrial processing, manufacturing, storage or distribution activities. These uses include, but are not limited to, electric power production, food and food by-product processing, paper production, agri-chemical production, chemical processes, storage facilities, metallurgical processes, mining and excavation processes, and processes using mineral products.

The Portal Bridge Capacity Enhancement Project does not meet the definition of an industry use. Therefore, this rule is not applicable.

7:7E-7.8: MINING USE RULE

New or expanded mining operations on land, and directly related development, for the extraction and/or processing of construction sand, gravel, ilmenite, glauconite, and other minerals are conditionally acceptable, provided that the specified conditions are met.

The Portal Bridge Capacity Enhancement Project does not meet the definition of a mining use. Therefore, this rule is not applicable.

7:7E-7.9: PORT USE RULE

Port uses are concentrations of shoreside marine terminals and transfer facilities for the movement of waterborne cargo (including fluids), and including facilities for loading, unloading and temporary storage.

The Portal Bridge Capacity Enhancement Project does not meet the definition of a port use. Therefore, this rule is not applicable.

7:7E-7.10 COMMERCIAL FACILITY USE RULE

This policy addresses use of commercial facilities such as hotels, motels, retail trade and services, and convention centers.

The Portal Bridge Capacity Enhancement Project does not meet the definition of a commercial use. Therefore, this rule is not applicable.

7:7E-7.11: COASTAL ENGINEERING

Coastal engineering includes a variety of structural and non-structural measures to manage water areas and the shoreline for natural effects of erosion, storms, and sediment and sand movement.

Preliminary engineering efforts for the proposed project do not anticipate structural and non-structural measures to manage water areas and the shoreline for natural effects of erosion, storms, and sediment and sand movement. The project believes that this rule is not applicable.

7:7E-7.12: DREDGED MATERIAL PLACEMENT ON LAND

Dredged material placement is the disposal or beneficial use of sediments removed during dredging operations.

As discussed under Policies 7:7E-4.6: Maintenance dredging and 7:7E-4.7: New Dredging, the Portal Bridge Capacity Enhancement Project does not involve site specific dredging. Therefore, this rule is not applicable.

7:7E-7.13: NATIONAL DEFENSE FACILITIES USE RULE

A national defense facility is any building, group of buildings, marine terminal, or land area owned or operated by a defense agency (Army, Navy, Air Force, Marines, Coast Guard) and used for training, research, material support, or any other defense related use.

The Portal Bridge Capacity Enhancement Project does not meet the definition of a port use. Therefore, this rule is not applicable.

7:7E-7.14: HIGH RISE STRUCTURES

High-rise structures are structures which are more than six stories or more than 60 feet in height as measured from existing preconstruction ground level. High-rise structures are encouraged to locate in an urban area of existing high density, high-rise and/or intense settlements. High-rise structures within the view of coastal waters shall be separated from coastal waters by at least one public road or an equivalent area (at least 50 feet) physically and visually open to the public except as provided by N.J.A.C. 7:7E-3.48. The proposed structure must not block the view of dunes, beaches, horizons, skylines, rivers, inlets, bays, or oceans that are currently enjoyed from existing residential structures, public roads or pathways, to the maximum extent practicable. The proposed structure must be in character with the surrounding transitional heights and residential densities, or be in character with a municipal comprehensive development scheme requiring an increase in height and density which is consistent with all applicable Coastal Zone Management rules. The proposed structure must not have an adverse impact on air quality, traffic, and existing infrastructure; and the proposed structure must be architecturally designed so as to not cause deflation of the beach and dune system or other coastal environmental waterward of the structure.

The Portal Bridge Capacity Enhancement Project will exceed the 60' height criteria described above as measured from the surface of the Hackensack River and associated wetlands. The proposed bridge(s) are located in an urban, highly developed area and are in character with the surrounding transitional heights (e.g. the New Jersey Turnpike span) and residential densities (i.e., low in the immediate project area). For example, the New Jersey Turnpike span that roughly parallels the proposed project has a vertical clearance above mean low water of 103 feet, according to data published on National Oceanographic and Atmospheric Administration (NOAA) Chart 12337 (Passaic and Hackensack Rivers). Similarly, overhead power cables nearby have a vertical clearance of 102 feet and 140 feet above mean low water. In addition, stacks for nearby industrial or electrical generation facilities (e.g. PSEG's Kearny Generating Station) are considerably higher than the 60 feet height specified in the rule. In light of the need to accommodate

maritime vessels with substantial air draft, the proposed project alternatives must be greater than 60 feet, the proposed project is entirely consistent with other nearby structures.

RESOURCE RULES

7:7E-8.2 MARINE FISH AND FISHERIES

Marine fish are marine and estuarine animals other than marine mammals and birds. Any activity that would adversely impact on the natural functioning of marine fish, including the reproductive, spawning and migratory patterns or species abundance or diversity of marine fish, is discouraged.

The Portal Bridge Capacity Enhancement Project crosses a tidal tributary and wetlands which may be used as a migratory pathway for certain species of marine fish. As discussed under Policies 7:7E-3.2 through 7:7E-3.5, the proposed project is not expected to result in adverse impacts to marine fish or other estuarine animals. Construction of in-water elements of the Portal Bridge Capacity Enhancement Project has the potential to temporarily affect certain diadromous fish species that may use the Hackensack River as a conduit to spawning grounds. These species include the anadromous American shad (*Alosa sapidissima*), blueback herring (*Alosa aestivalis*), alewife (*Alosa pseudoharengus*), striped bass (*Morone americana*), and the catadromous American eel (*Anguilla rostrata*). Potential construction impacts include resuspension of sediments and anthropogenic noise associated with construction activities. The project would work in consultation with the NJDEP to adjust construction methods and schedule to reduce impacts to migratory fish species based on their seasonal presence in the project area. For example, herring migration is closely linked to water temperature. In this example, temperatures in excess of those at which anadromous species migrate and/or spawn may allow for some flexibility in the permitted construction methods and schedule. No operational effects of the bridge are expected, because in-water elements of the build alternatives would not obstruct fish passage or habitat.

7:7E-8.4: WATER QUALITY

As required by Section 307(f) of the Federal Coastal Zone Management Act (P.L. 92-583), Federal, State and local water quality requirements established under the Clean Water Act (33 U.S.C. 1251) shall be the water resource standards of the coastal management program. These requirements include not only the minimum requirements imposed under the Clean Water Act but also the additional requirements adopted by states, localities, and interstate agencies pursuant to Section 510 of the Clean Water Act and such statutes as the New Jersey Water Pollution Control Act. In the waters under the jurisdiction of the Interstate Sanitation Commission in the New Jersey-New York metropolitan area, the requirements include the Interstate Sanitation Commission's Water Quality Regulations. Department rules related to water pollution control and applicable throughout the entire coastal zone include, for example, the Surface Water Quality Standards (N.J.A.C. 7:9-4), the rules concerning Wastewater Discharge Requirements (N.J.A.C. 7:9-5), the Ground-Water Quality Standards (N.J.A.C. 7:9-6), and the Regulations Concerning the New Jersey Pollutant Discharge Elimination System (N.J.A.C. 7:14A).

The Hackensack River is designated Use Class SE2. In all SE2 waters, the designated uses are:

- Maintenance, migration, and propagation of the natural and established biota;
- Migration of diadromous fish;
- Maintenance of wildlife;
- Secondary contact recreation; and
- Any other reasonable uses.

Tidal tributaries in the project area are designated Use Class FW2-NT/SE2. The SE2 designation is defined above, while the NT designation indicates that the tributaries are not designated as trout waters. The FW2 general surface water classification is applied to those fresh waters that are not designated as FW1 or pineland waters. In all FW2 waters the designated uses are:

- Maintenance, migration, and propagation of the natural and established biota;
- Primary and secondary contact recreation;
- Industrial and agricultural water supply;
- Public potable water supply after conventional filtration treatment (a series of processes including filtration, flocculation, coagulation, and sedimentation, resulting in substantial particulate removal but no consistent removal of chemical constituents) and disinfection; and
- Any other reasonable uses.

As of 2006, the Hackensack River in the project area was in non-attainment of Surface Water Quality Standards for New Jersey Waters for aquatic life (general) and for fish consumption. Waters below the Portal Bridge are in full attainment for industrial water supply. Insufficient data exist to designate attainment status for the Hackensack River near the project area for primary and secondary contact recreation, drinking water supply, or agricultural water supply (NJDEP 2006).[38]

The New York Harbor Estuary and its tributaries have had a long history of industrialization along its shores, which continues to affect water quality as pollutants residing mostly in the sediments are dissolved and redistributed. In a tidally mixed water body, water exchange with the Atlantic Ocean tends to dilute waterborne contaminants, but the historically degraded sediments continue to provide new contaminants that affect water quality. Thus, the water quality of the system is coupled tightly to the quality of sediments, but can also be affected by other sources (e.g., industrial discharges).

Many area sediments contain low concentrations of contaminants such as heavy metals, PCBs, PAHs, and other organic compounds. Sediments nearest former (or active) industrial sites may exhibit much higher local concentrations, and can result in localized areas of high contaminant concentrations, or "hot spots." Active and closed landfills abut many of the region's waterways and may leach contaminants into the waters. In addition, many former wetlands throughout the region have been filled with a mixture of materials including municipal waste and incinerator ash. Lastly, combined sewer outfalls (CSOs) contribute significantly to regional pollution by introducing fecal coliform bacteria, floatable debris, and other contaminants. Recent sediment quality investigations near the project area have revealed the presence of a number of contaminants present in Hackensack Meadowlands sediments, including chromium, lead, arsenic, mercury, 4,4'-DDE (a pesticide), flouranthane, pyrene, anthracene, and many others (Barrett and McBrien 2007).[39] Other investigators have identified a similar suite of contaminants,

[38] New Jersey Department of Environmental Protection (NJDEP). *New Jersey Integrated Water Quality Monitoring and Assessment Report.* Trenton, NJ. December 2006.

[39] Barrett, K.R., and M.A. Mcbrien. "Chemical and biological assessment of an urban, estuarine marsh in Northeastern New Jersey, USA." Environ. Monit. Assess. 124:63-88. 2007.

all within a few river miles of the project site (e.g., Weis et al. 2004,[40] Sorensen et al. 2007,[41] Bonnevie et al. 1993[42]).

The Portal Bridge Capacity Enhancement Project would not result in any long-term adverse effects to water quality or stormwater in the study area. Most of the proposed project elements would be pervious—including new rail embankments and the open deck moveable bridge—and would therefore not affect stormwater percolation. Some project elements, including the concrete deck on the new fixed bridge, would be impervious. Direct discharges of stormwater to surface waters would be avoided through implementation of a stormwater collection system for these structures. Stormwater would be rerouted through nearby wetlands to control stormwater pollutant loadings to nearby surface waters. The additional in-water structures, when considered in conjunction with the removal of the existing pivot pier, would not alter the flow characteristics of the Hackensack River.

All construction activities will be conducted in accordance with applicable water quality regulations as defined in this rule. All stormwater outfalls and associated appurtenances will be designed in accordance with best management practices (BMPs), Surface Water Quality Standards (N.J.A.C. 7:9-4), the rules concerning Wastewater Discharge Requirements (N.J.A.C. 7:9-5), the Ground-Water Quality Standards (N.J.A.C. 7:9-6), the Regulations Concerning the New Jersey Pollutant Discharge Elimination System (N.J.A.C. 7:14A), and in accordance with N.J.A.C. 7:7E-4.17 discussed above.

7:7E-8.5: SURFACE WATER USE

Surface water is water in lakes, ponds, streams, rivers, bogs, wetlands, bays, and ocean that is visible on land. Coastal development shall demonstrate that the anticipated surface water demand of the facility will not exceed the capacity, including phased planned increases, of the local potable water supply system or reserve capacity, and that construction of the facility will not cause unacceptable surface water disturbances, such as drawdown, bottom scour, or alteration of flow patterns.

There is no surface water demand required for the Portal Bridge Capacity Enhancement Project. Therefore this rule is not applicable.

7:7E-8.6: GROUNDWATER USE

Groundwater is all water within the soil and subsurface strata that is not at the surface of the land. It includes water that is within the earth that supplies wells and springs. Coastal development shall demonstrate, to the maximum extent practicable, that the anticipated groundwater withdrawal demand of the development, alone and in conjunction with other groundwater diversions proposed or existing in the region, will not cause salinity intrusions into the groundwaters of the zone, will not degrade groundwater quality, will not significantly lower the water table or piezometric surface, or significantly decrease the base flow of adjacent water sources.

Dewatering of groundwater would most likely be required in specific locations, depending on the final determination of the types of foundations to be used for bridges, viaducts, and retaining walls, as well as the ultimate construction methods. Where dewatering is required, it is possible that the water would require treatment prior to its discharge to surface water or existing sewers. Prior to any such discharge,

the water would be tested. Discharge of water would be conducted in accordance with applicable requirements, including NPDES for discharge to surface water, and state and local requirements for sewer discharge.

7:7E-8.7: STORMWATER MANAGEMENT

If a project or activity meets the definition of "major development" at N.J.A.C. 7:8-1.2, then the project or activity shall comply with the Stormwater Management rules at N.J.A.C. 7:8.

All construction activities will be conducted in accordance with applicable water quality regulations as defined in this rule. All stormwater outfalls and associated appurtenances will be designed in accordance with best management practices (BMPs), Surface Water Quality Standards (N.J.A.C. 7:9-4), the rules concerning Wastewater Discharge Requirements (N.J.A.C. 7:9-5), the Ground-Water Quality Standards (N.J.A.C. 7:9-6), the Regulations Concerning the New Jersey Pollutant Discharge Elimination System (N.J.A.C. 7:14A), and in accordance with N.J.A.C. 7:7E-4.17 discussed above.

7:7E-8.8: VEGETATION

Vegetation is the plant life or total plant cover that is found on a specific area, whether indigenous or introduced by humans. Coastal development shall preserve, to the maximum extent practicable, existing vegetation within a development site. Coastal development shall plant new vegetation, particularly appropriate coastal species native to New Jersey to the maximum extent practicable.

The proposed project will impact wetland and upland vegetation through direct loss, shading impacts, and temporary construction disturbance. All permanent loss of wetland vegetation has been quantified in Table 1 and will be mitigated as discussed under N.J.A.C. 7:7E-3.27 (Wetlands) and N.J.A.C. 7:7E-3.28 (Wetlands Buffers). Riparian vegetation, as described in N.J.A.C. 7:7E-3.26, impacted by the Portal Bridge Capacity Enhancement Project will be mitigated in accordance with the guidelines provided in the Flood Hazard Area Control Act rules at N.J.A.C. 7:13.

7:7E-8.9: (RESERVED)

7:7E-8.10: AIR QUALITY

The protection of air resources refers to the protection from air contaminants that injure human health, welfare or property, and the attainment and maintenance of State and Federal air quality goals and the prevention of degradation of current levels of air quality.

Coastal development shall conform to all applicable State and Federal regulations, standards and guidelines and be consistent with the strategies of New Jersey's State Implementation Plan (SIP). See N.J.A.C. 7:27 and New Jersey SIP for ozone, particulate matter, sulfur dioxide, nitrogen dioxide, carbon monoxide, lead, and visibility.

Coastal development shall be located and designed to take full advantage of existing or planned mass transportation infrastructures and shall be managed to promote mass transportation services, in accordance with the Traffic rule, N.J.A.C. 7:7E-8.14.

As amended in 1990, the Clean Air Act (CAA) defines non-attainment areas (NAA) as geographic regions that have been designated as not meeting one or more of the NAAQS. When an area is designated as non-attainment by USEPA, the state is required to develop and implement a State Implementation Plan (SIP), which delineates how a state plans to achieve air quality that meets the NAAQS under the deadlines established by the CAA.

The project area falls within areas that are designated as non-attainment for ozone and $PM_{2.5}$, and maintenance for CO. The NJDEP announced a proposal to revise the ozone SIP to demonstrate that its two multi-state 8-hour ozone nonattainment areas (associated with the New York City and Philadelphia metropolitan areas) will attain the 8-hour ozone NAAQS by their mandatory attainment date of June 15, 2010. In 2006, USEPA lowered the NAAQS for 24-hour $PM_{2.5}$ from 65 $\mu g/m^3$ to 35 $\mu g/m^3$. Each state is

required to make recommendations to USEPA for designating nonattainment areas for the 24-hour standard. If NJDEP recommendations are adopted by USEPA, Hudson County, which is currently designated as an annual $PM_{2.5}$ nonattainment area would also be designated nonattainment for the 24-hour $PM_{2.5}$ standard. Final USEPA designations are expected by December 18, 2008.

As an FRA action, the Portal Bridge Capacity Enhancement Project must conform to the purpose of State Implementation Plans for ozone, $PM_{2.5}$, and CO to meet and maintain the NAAQS in New Jersey and multi-state nonattainment and maintenance areas. The applicable *de minimis* threshold for each pollutant or its precursor is 100 tons per year with the exception of volatile organic compounds, for which the threshold is 50 tons per year since Hudson County is within an ozone transport zone. The Portal Bridge Capacity Enhancement Project would not exceed these *de minimis* thresholds for any criteria pollutant either during construction or operation of the project. By directly and indirectly contributing to an increase in public transportation ridership, the Portal Bridge Capacity Enhancement Project would actually result in a net long-term emission decrease in emissions and overall benefits to regional air quality. On a short-term basis, during project construction it is estimated that annual emission burdens of particulate matter and VOC's would be less than one ton per year and emissions of nitrogen oxides (NO_x) would be approximately 15 tons per year.

During the construction process, the pollutants of concern include particulate matter (both $PM_{2.5}$ and PM_{10}) and nitrogen dioxide, due to the number of diesel-powered engines that may be involved in the construction process. Diesel particulate matter is a concern, particularly from non-road sources that have traditionally been subject to lower emission standards than on-road sources. However, the potential for adverse air quality impacts during construction of the build alternatives would be minimized for several reasons. First, the construction site is almost entirely surrounded by areas of limited access to the general public and is away from any sensitive air quality receptors (i.e., residences, schools, hospitals). Due to the availability of rail and water access, truck trips would be minimized and established truck routes would be utilized, further lowering the potential for diesel particulate emissions through commercial or residential areas. Finally, the project would utilize ultra low sulfur diesel fuel for the non-road construction equipment that would be employed on-site during the duration of the construction process.

7:7E-8.11: PUBLIC TRUST RIGHTS

Public trust rights to tidal waterways and their shores (public trust rights) established by the Public Trust Doctrine include public access which is the ability of the public to pass physically and visually to, from and along lands and waters subject to public trust rights as defined at N.J.A.C. 7:7E-3.50, and to use these lands and waters for activities such as swimming, sunbathing, fishing, surfing, sport diving, bird watching, walking and boating. Public trust rights also include the right to perpendicular and linear access. Public accessways and public access areas provide a means for the public to pass along and use lands and waters subject to public trust rights.

Except as otherwise provided, development on or adjacent to all tidal waterways and their shores shall provide on-site, permanent, unobstructed public access to the tidal waterway and its shores at all times, including both visual and physical access. The perpendicular access and linear area provided for sites located along the Arthur Kill, Kill Van Kull west of Bayonne Bridge, Newark Bay, Delaware River from the Trenton Makes Bridge to the CAFRA boundary, Elizabeth River, Hackensack River, Passaic River, Rahway River, Raritan River, Cohansey River in Bridgeton City, and Maurice River in Millville City, shall comply with the conditions of this policy.

The proposed project will work collaboratively with NJDEP, Hudson County, Amtrak and other project stakeholders to provide safe and secure public access in accordance with this policy. The specific details of the public access location and design will depend upon considerations of public safety, railroad security, environmental impacts, and other potential effects.

7:7E-8.12: SCENIC RESOURCES AND DESIGN

Scenic resources include the views of the natural and/or built landscape. Large-scale elements of building and site design are defined as the elements that comprise the developed landscape such as size, geometry, massing, height and bulk structures. New coastal development that is visually compatible with its surroundings in terms of building and site design, and enhances scenic resources is encouraged. New coastal development that is not visually compatible with existing scenic resources in terms of large-scale elements of building and site design is discouraged.

The proposed project is consistent with existing land uses. The area is a transportation nexus with numerous rail and highway bridges (e.g. the New Jersey Turnpike bridge) crossing the Hackensack River near the proposed project. In addition, the surrounding lands are highly industrialized and dominated by steam electric generation facilities, manufacturing facilities, and warehouse facilities. The proposed development is consistent with these uses and this Rule.

7:7E-8.14: TRAFFIC

Traffic is the movement of vehicles, pedestrians or ships along a route. Coastal development shall be designed, located and operated in a manner to cause the least possible disturbance to traffic systems. Alternative means of transportation, that is, public and private mass transportation facilities and services, shall be considered and, where feasible, incorporated into the design and management of a proposed development, to reduce the number of individual vehicle trips generated as a result of the facility.

The Portal Bridge Capacity Enhancement Project is being designed as an improvement to the capacity of an existing mass transportation corridor. In addition, proposed bridge spans have been designed to reduce the frequency of bridge openings (of the existing swing bridge) by raising the vertical clearances for maritime traffic. Therefore, the proposed project directly alleviates rail and maritime traffic conflict.

7:7E-8.15 (RESERVED)

7:7E-8.16 (RESERVED)

7:7E-8.17 (RESERVED)

7:7E-8.18 (RESERVED)

7:7E-8.19 (RESERVED)

7:7E-8.20 (RESERVED)

7:7E-8.21 SUBSURFACE SEWAGE DISPOSAL SYSTEMS

Subsurface sewage disposal system means a system for disposal of sanitary sewage into the ground which is designed and constructed to treat sanitary sewage in a manner that will retain most of the settleable solids in a septic tank and to discharge the liquid effluent to a disposal field.

The Portal Bridge Capacity Enhancement Project does not include the installation of any type of sanitary sewage system. Therefore, this rule is not applicable.

7:7E-8.22 SOLID AND HAZARDOUS WASTE

Solid waste means any garbage, refuse, sludge or other waste material, including solid, liquid, semi-solid or contained gaseous material. A material is a solid waste if it is "disposed of" by being discharged, deposited, injected, dumped, spilled, leaked or placed into or on any land or water so that such material or any constituent thereof may enter the environment or be emitted into the air or discharged into ground or surface waters. Solid waste becomes a hazardous waste when it exhibits any of the characteristics which are specified in the Federal Regulations on Identification and Listing of Hazardous Waste (40 C.F.R. 261). The general characteristics of hazardous waste include, but are not limited to,

characteristics of ignitibility, characteristics of corrosivity, characteristics of reactivity and characteristics of toxicity. Coastal development shall conform with all applicable State and Federal regulations, standards and guidelines for the handling and disposal of solid and hazardous wastes, including the Solid Waste Management Act, N.J.S.A. 13:1E-1 et seq., the Solid Waste Management rules, N.J.A.C. 7:26, the Recycling rules, N.J.A.C. 7:26A, and the Hazardous Waste rules, N.J.A.C. 7:26G.

The construction of the proposed project may generate solid and/or hazardous waste as may be related to demolition of existing structures, site preparation, and excavation, as applicable. All activities will conform to the applicable State and Federal regulations, standards and guidelines for the handling and disposal of solid and hazardous wastes, including the Solid Waste Management Act, N.J.S.A. 13:1E-1 et seq., the Solid Waste Management rules, N.J.A.C. 7:26, the Recycling rules, N.J.A.C. 7:26A, and the Hazardous Waste rules, N.J.A.C. 7:26G. ✷

Ms. Christie Marcella
Portal Bridge Capacity Enhancement Project
c/o Howard/Stein-Hudson Associates, Inc.
517 West 35th Street, 7th Floor
New York, New York 10001

Dear Ms. Marcella:

The U.S. Fish and Wildlife Service (Service) has reviewed the Scoping Document for the proposed Portal Bridge Capacity Enhancement project located in Kearny and Secaucus, Hudson County, New Jersey.

AUTHORITY

This response is provided pursuant to the National Environmental Policy Act of 1969 as amended (83 Stat. 852; 42 U.S.C. 4321 *et seq.*) (NEPA), the Endangered Species Act of 1973 (87 Stat. 884, as amended; 16 U.S.C. 1531 *et seq.*) (ESA), the Migratory Bird Treaty Act of 1918 (40 Stat. 755, as amended; 16 U.S.C. 703-712), and consistent with the intent of the Service's Mitigation Policy (*Federal Register*, Vol. 46, No. 15, Jan. 23, 1981). These comments do not preclude separate review and comments by the Service pursuant to the Fish and Wildlife Coordination Act (48 Stat. 401, as amended; 16 U.S.C. 661 *et seq.*) or future review pursuant to NEPA.

BACKGROUND

The Federal Railroad Administration (FRA) (lead federal agency), Amtrak, and the New Jersey Transit Corporation propose to improve or replace the nearly 100-year-old Portal Bridge, which is a two-track, moveable swing-span rail bridge over the Hackensack River. On December 12, 2006, the FRA issued a Notice of Intent (NOI) to prepare an Environmental Impact Statement pursuant to NEPA. Alternatives under consideration include replacement, rehabilitation or modification of the existing bridge along with the construction of an additional bridge for added capacity. The general purpose of the project is to address mechanical, operational, maintenance, and capacity problems with the existing bridge. The Portal Bridge project is being coordinated with planning for the Access to the Region's Core (ARC) project, which involves a new passenger rail tunnel under the Hudson River and other new rail infrastructure.

The Portal Bridge Enhancement project may require State permits, a U.S. Coast Guard permit pursuant to Section 9 of the Rivers and Harbors Act of 1899 (30 Stat. 1151, as amended; 33 U.S.C. 403 *et seq.*), and a Department of the Army permit pursuant to Section 404 of the Clean Water Act (33 U.S.C. 1344 *et seq.*) and/or Section 10 of the Rivers and Harbors Act. The Service met with project proponents during the December 20, 2006 meeting of the Meadowlands Interagency Mitigation Advisory Committee (MIMAC), and attended a January 9, 2007 scoping meeting.

FEDERALLY LISTED SPECIES

Except for an occasional transient bald eagle (*Haliaeetus leucocephalus*), no other federally listed or proposed endangered or threatened flora or fauna under Service jurisdiction are known to occur within the vicinity of the proposed project site. Therefore, no further consultation pursuant to Section 7 of the ESA is required by the Service. If additional information on federally listed species becomes available, or if project plans change, this determination may be reconsidered.

MEADOWLANDS ECOSYSTEM

The Hackensack Meadowlands includes 8,400 acres of wetlands and uplands that support remarkable biodiversity. Species that use the Meadowlands include seventy-five percent of the 443 migratory bird species documented in New Jersey, 65 species of nesting birds, over 50 species of fish and shellfish, approximately 25 State-listed species, and 42 species considered rare or uncommon in the urban core. Over the last 150 years, industry and development have filled over half of the Meadowlands' original 21,000 wetland acres, and have polluted and fragmented its lands and waters. Congress has directed the Service to provide technical assistance for the restoration and protection of the Meadowlands (P.L. 109-54; see H.R. 109-80). The Service's New Jersey Field Office is fulfilling this directive through the *Hackensack Meadowlands Initiative: Preliminary Conservation Planning* and other work activities (fact sheets enclosed).

Wetlands and open waters adjacent to the subject rail bridge are targeted for restoration through the U.S. Army Corps of Engineers, New York District's (Corps) Hackensack Meadowlands Ecosystem Restoration Study (HMER). Candidate HMER restoration sites along the Portal Bridge approaches include Kearny Brackish Marsh, Laurel Hill Park Wetland, and Riverbend Wetland Preserve (U.S. Army Corps of Engineers, 2004). According to New Jersey's Landscape Project mapping, these wetlands provide foraging habitat for colonial-nesting waterbirds (Niles *et al.*, 2004). The New Jersey Meadowlands Commission (NJMC) is currently working with Hudson County and the New York-New Jersey Baykeeper on development of a restoration plan for Laurel Hill Park Wetland.

The northern approach to the Portal Bridge passes along the 67-acre, privately-owned Malanka Landfill. Operation of the landfill ceased in 1983, but the site was not formally closed in accordance with State standards (New Jersey Meadowlands Commission, 2004). A closure plan for the landfill was prepared in 1999 (U.S. Corps of Engineers, 2004). The southern approach and the bridge itself cross an area of land and water currently under investigation by the New

Jersey Department of Environmental Protection[1] for environmental contamination related to three known contaminated sites: Diamond Shamrock Corporation, Koppers Company Inc. Seaboard Plant, and Standard Chlorine Chemical Company Inc.

SERVICE RECOMMENDATIONS

The Service will provide ongoing input to the Portal Bridge project through the MIMAC and the NEPA process. We offer the following preliminary recommendations based on the NOI, the Scoping Document, and meetings attended to date.

- Contact the New Jersey Endangered and Nongame Species Program[2] (ENSP) to determine the recent history of nesting by the State-listed (endangered) peregrine falcon (*Falco peregrinus*) on bridges in the vicinity of the Portal Bridge. The ENSP may recommend Conservation Measures to protect peregrines during construction and/or provisions for post-construction bridge operation and management. Peregrines are known to nest on man-made structures within 1.5 miles of the Portal Bridge.

- Contact the New Jersey Natural Heritage Program[3] to determine any need to survey the project area for the presence or absence of the State-listed (endangered) plant wafer ash (*Ptelea trifoliate*), which is known to occur in the general vicinity.

- Avoid and minimize impacts to wetlands, especially candidate HMER restoration sites.

- Coordinate with the Hudson County Planning Department and the New York-New Jersey Baykeeper to ensure the Portal Bridge project does not jeopardize restoration of Laurel Hill Park Wetland.

- Construct any new or expanded rail infrastructure on elevated structures rather than fill embankments, when location of such facilities in wetlands is unavoidable.

- Remediate contamination in any new or expanded rights-of-way to the final clean-up standards specified by the U.S. Environmental Protection Agency and/or the New Jersey Department of Environmental Protection, since the presence of new rail infrastructure will preclude any additional remedial efforts following construction.

- Assess the potential release of environmental contaminants from temporary disturbances to wetlands and open waters. Use best management practices to contain contaminants during construction, and provide for post-construction remediation and long-term (3-10 years) contaminants monitoring of disturbed areas.

- Investigate options for compensatory mitigation at HMER candidate restoration sites. Any such plans would require early coordination with the Corps, the NJMC, and the MIMAC.

- Investigate combined mitigation with the ARC project.

Re: Threatened or Endangered Species Information Request
Portal Bridge Capacity Enhancement Project
Milepost 6.1 along Amtrak's Northeast Corridor
Between the City of Kearny and the City of Secaucus, Hudson County, New Jersey

Dear Mr. Jenkins:

The Federal Railroad Administration (FRA), in cooperation with the National Railroad Passenger Corporation (Amtrak) and the New Jersey Transit Corporation (NJ TRANSIT), are proposing to enhance the capacity and improve the operation of the Portal Bridge, a two-track rail crossing over the Hackensack River between the City of Kearny and the City of Secaucus, Hudson County, New Jersey. The Portal Bridge, which began operation in 1910, creates a bottleneck along Amtrak's Northeast Corridor and impedes efficient and reliable passenger rail service. An Environmental Impact Statement (EIS) is being prepared to analyze the potential environmental impact from the proposed project, including several project alternatives. The Portal Bridge Capacity Enhancement Project (the Project) will require coordination with the Federal Transit Administration (FTA), the U.S. Coast Guard (USCG), in addition to applicable natural resource and regulatory agencies including the U.S. Fish and Wildlife Service (USFWS), National Marine Fisheries Service (NMFS), U.S. Army Corps of Engineers (USACE), New Jersey Department of Environmental Protection's (NJDEP) Natural Heritage Program, and the NJDEP's Endangered and Nongame Species Program.

On January 9, 2007 AKRF, Inc. staff met with the USFWS and other agencies in Newark, NJ for a scoping meeting of the proposed project. The USFWS followed up with a letter dated February 2, 2007 reflecting on the Scoping Document and scoping meeting. The letter recommended that the New Jersey Endangered and Nongame Species Program (ENSP) be contacted specifically to determine the recent history of nesting by the State-listed (endangered) peregrine falcon (*Falco peregrinus*) on bridges in the vicinity of Portal Bridge.

On behalf of the FRA, Amtrak, and NJ Transit we would like to request information on peregrine falcons and any other federally listed threatened or endangered species, species of special concern, and habitats of special concern within the study area for the proposed project (see Figures 1 and 2). The information provided by the ENSP will be used for evaluation of potential environmental impacts associated with this proposed project. Map(s) showing specific locations of sensitive species or habitats developed lists provided by ENSP will not be published in any document. As part of this process, we also have requested similar information on rare species from the Natural Heritage Program, and other applicable natural resource agencies.

Please send the requested information to me at the address indicated above and feel free to call me at (856) 797-9930, extension 1624, if you should have any questions regarding this information request. Thank you for your time in providing us with this information.

Sincerely,

Michael Clayton
Environmental Scientist

Re: New Jersey Transit Portal Bridge Replacement (20214)

Dear Mr. Clayton:

Thank you for your data request regarding rare species information for the above referenced project site in Kearny Town and Secaucus Town, Hudson County.

Searches of the Natural Heritage Database and the Landscape Project (Version 2) are based on a representation of the boundaries of your project site in our Geographic Information System (GIS). We make every effort to accurately transfer your project bounds from the topographic map(s) submitted with the Request for Data into our Geographic Information System. We do not typically verify that your project bounds are accurate, or check them against other sources.

We have checked the Natural Heritage Database and the Landscape Project habitat mapping for occurrences of any rare wildlife species or wildlife habitat on the referenced site. Please see Table 1 for species list and conservation status.

Table 1 (on referenced site).

Common Name	Scientific Name	Federal Status	State Status	Grank	Srank
colonial waterbird foraging habitat					

We have also checked the Natural Heritage Database and the Landscape Project habitat mapping for occurrences of any rare wildlife species or wildlife habitat within one half mile of the referenced site. Please see Table 2 for species list and conservation status. This table excludes any species listed in Table 1.

Table 2 (additional species within one half mile of referenced site).

Common Name	Scientific Name	Federal Status	State Status	Grank	Srank
American coot	*Fulica americana*		D	G5	S1B
coastal heron rookery				GU	S3
peregrine falcon	*Falco peregrinus*		E	G4	S1B,S?N
pied-billed grebe	*Podilymbus podiceps*		E/S	G5	S1B,S3N

We have also checked the Natural Heritage Database for occurrences of rare plant species or ecological communities. The Natural Heritage Database has a record for an occurrence of *Ptelea trifoliata* that may be on the site. The attached list provides more information about this occurrence. **Because some species are sensitive to disturbance or sought by collectors, this information is provided to you on the condition that no specific locational data are released to the general public. This is not intended to preclude your submission of this information to regulatory agencies from which you are seeking permits.**

Also attached is a list of rare species and ecological communities that have been documented from Hudson County. If suitable habitat is present at the project site, these species have potential to be present.

Status and rank codes used in the tables and lists are defined in the attached EXPLANATION OF CODES USED IN NATURAL HERITAGE REPORTS.

If you have questions concerning the wildlife records or wildlife species mentioned in this response, we recommend that you visit the interactive I-Map-NJ website at the following URL, http://www.state.nj.us/dep/gis/depsplash.htm or contact the Division of Fish and Wildlife, Endangered and Nongame Species Program at (609) 292 9400.

PLEASE SEE THE ATTACHED 'CAUTIONS AND RESTRICTIONS ON NHP DATA'.

Thank you for consulting the Natural Heritage Program. The attached invoice details the payment due for processing this data request. Feel free to contact us again regarding any future data requests.

Sincerely,

Herbert A. Lord

SUBJECT: Federal Transit Administration/NJ Transit/Amtrak
Portal Bridge Capacity Enhancement Project
Kearny and Secaucus, Hudson Co., NJ

Karen Greene
(Reviewing Biologist)

We have reviewed the information provided to us regarding the above subject project. We offer the following preliminary comments pursuant to the Endangered Species Act, the Fish and Wildlife Coordination Act and the Magnuson-Stevens Fishery Conservation and Management Act **for all project segments.**

Endangered and Threatened Species

No threatened or endangered species under NMFS' jurisdiction are expected to occur in project area.

Fish and Wildlife Coordination Act

The waters of the Hackensack River provide habitat for a wide variety of species of concern to NMFS including, anadromous and resident fish, forage and benthic species such as American shad, alewife, blueback herring, striped bass, winter flounder, bluefish, bay anchovy, white perch, weakfish, summer flounder, American eel and spot.

DEPENDING UPON THE PROJECT DETAILS POSSIBLE RECOMMENDATIONS INCLUDE:

Impacts to wetlands and other aquatic habitats should be minimized to the maximum extent practicable. Seasonal restrictions on in-water work may be recommended depending upon the project details. The typical seasonal work restriction to protect anadromous fish migration is no in water work from April 1 to June 30 of any year. Compensatory mitigation should be provided for all unavoidable impacts to wetlands and other waters of the US.

Magnuson-Stevens Fishery Conservation and Management Act
Essential Fish Habitat

The estuarine waters of the Hackensack River have been designated as Essential Fish Habitat (EFH) for one or more species. Further EFH consultation by the lead federal action agency will be necessary as part of the federal permit process. For a listing of EFH and further information, please go to our website at: http://www.nero.noaa.gov/hcd. If you wish to discuss this further, please call 732-872-3023.

RE: Portal Bridge Capacity Enhancement Study
Hudson County, New Jersey
Request for Support of Federal Funding
General Concurrence – No Objection to Funding

Dear Mr. Wilkins:

This letter is in response to your submittal dated May 15, 2008 regarding support for Federal funding of the Portal Bridge Capacity Enhancement Project. The New Jersey Department of Environmental Protection (NJDEP), Division of Land Use Regulation has no objection to the use of Federal funds for this project.

If in the future this project will need state or federal approvals such as permits or licenses, the NJDEP will conduct a separate review for those permit activities. The current review pertains only to federal funding.

Please feel free to contact, Charles Welch, at 609-777-0454 if you have any further questions regarding this letter.

Sincerely,

Christopher Jones, Manager
Bureau of Urban Growth and Redevelopment

Re: Federal Consistency Determination
DLUR File No.: 0900-07-0001.1; CDT 080001
Applicant: The National Railroad Passenger Corporation (Amtrak) and the New Jersey Transit Corporation (NJ TRANSIT)
Project: Portal Bridge Capacity Enhancement Project
Location: Secaucus and Kearny, Hudson County

Dear Mr. Wilkins:

The New Jersey Department of Environmental Protection, Division of Land Use Regulation (Division), acting pursuant to Section 307 of the Federal Coastal Zone Management Act of 1972 (P.L. 92-583) as amended, has reviewed your proposal of the Portal Bridge Capacity Enhancement Project located in the Hackensack Meadowlands District, Town of Secaucus and Town of Kearny, Hudson County. The Division has determined that the proposed activity, as described in the document entitled "Final Environmental Impact Statement, Chapter 9: Comparison of Alternatives" prepared by AKRF Environmental and Planning Consultants, dated May 21, 2008, is consistent with New Jersey's Coastal Zone Management Rules N.J.A.C. 7:7E-1.1 et seq, as amended to April 7, 2008 provided that the conditions provided below are met to the satisfaction of the Department of Environmental Protection.

Project Description

The Federal Transportation Administration is the project sponsor for the Portal Bridge Capacity Enhancement Project.

The applicant, Amtrak/NJ TRANSIT, is proposing to enhance the capacity and improve the operation of the Portal Bridge, a rail crossing over the Hackensack River in Hudson County. The project area extends east to west from the Secaucus Transfer Station (aka "Frank R. Leutenberg Station" or "Secaucus Junction") to Kearny Junction Interlocking and north to south 2,000 feet from the Northeast Corridor. The selected scenario includes a three-track fixed northern bridge, a two-track removable southern bridge built on a new southern alignment, and a duck-under structure for Track 5, which is the type of grade-separated crossing provided for one track. Specifically, the proposed project will permanently impact 0.79 acres of State open waters, 0.16 acres of intertidal/subtidal shallows, and 5.7 acres of freshwater wetlands, and temporary impact 7.67 acres of freshwater wetlands.

Purpose of Proposed Project

The purpose of the Portal Bridge Capacity Enhancement Project is to: 1) enhance capacity to meet current and future demand, 2) improve service reliability and operational flexibility, 3) provide a

redundant Hackensack River crossing to facilitate maintenance and enhance passenger safety and security, 4) minimize conflicts with maritime traffic, 5) optimize existing infrastructure and planned improvements, and 6) minimize impacts on the surrounding environment.

The existing Portal Bridge is a two-track, moveable swing-span bridge that was constructed by the Pennsylvania Railroad and began operation in 1910. The Portal Bridge has become a bottleneck along the Northeast Corridor that conflicts with marine traffic and impedes efficient and reliable passenger rail service. Amtrak carries approximately 15,700 passengers each day in each direction over the Portal Bridge, including 3,900 passengers per day on the time-sensitive premium Acela Express service. NJ TRANSIT carries an average of 150,000 passengers per day in both directions over the Portal Bridge on almost 350 trains.

Amtrak's and NJ TRANSIT's primary goal of the Portal Bridge Capacity Enhancement Project is to improve rail operations and eliminate delay issues and continue to provide uninterrupted service to the public.

Mitigation Conditions

The following special conditions must be met for the activity to be authorized under these permits:

1. **The mitigation project must be conducted prior to or concurrent with the construction of the approved project.**

2. Mitigate for the permanent impact to 0.79 acres of state open water, 0.16 acres of intertidal subtidal shallows, and 5.7 acres of wetlands through an on or offsite mitigation plan as detailed in condition number 3 below.

2a. Mitigate for the temporary loss of 7.67 acres through an onsite restoration plan, as detailed below:

   i. Provide a detailed breakdown by habitat type for all temporary impacts.

   ii. Provide a detailed restoration plan for all temporary impacts that includes all proposed seed mixes, planting stock, planting density, planting quantities.

3. For an on-site or off-site individual mitigation project the permittee must submit a mitigation proposal to the Division of Land Use Regulation (Division) Mitigation Unit, to mitigate for any temporary impacts to wetlands and intertidal subtidal shallows and to either create an area of wetlands or intertidal subtidal shallows or enhance a degraded wetlands system as per N.J.A.C. 7:7E-3.15(h) for review and approval. If the permittee is proposing to construct an intertidal subtidal shallows creation project, one acre of creation must be performed for each acre disturbed. If the permittee is proposing a wetlands creation or restoration project, the ratio is 2:1. If the permittee is proposing enhancement, the ratio of wetlands enhanced to wetlands disturbed shall be determined by the Division on a case-by-case basis sufficient to replace the loss of ecological value from the permitted project.

   The following conditions and information must be adhered to when performing mitigation.

   a. Submit for review and approval a conceptual plan showing the location and proposed hydrology of the mitigation site.

   b. Once the Division has approved the conceptual plan of the mitigation project, the permittee must submit a final design of the mitigation project.

4. In accordance N.J.A.C. 7:7A-15.13, obtain a secured bond, or other financial surety acceptable to the Department including an irrevocable letter of credit or money in escrow, that shall be sufficient to hire an independent contractor to complete and maintain the proposed mitigation should the permittee default. The financial surety for the construction of the mitigation project shall be posted in an amount equal to 115 percent of the estimated cost of the construction. In addition, financial surety to assure the success and maintenance of the mitigation project shall be posted in an amount equal to 30 percent of the estimated cost of construction. The Department will review the financial surety annually and the permittee shall adjust the surety to reflect current economic factors. Please be advised if a governmental body is performing the mitigation the need for financial assurance is waived.

5. Prior to the commencement of the mitigation project, the permittee shall complete and sign the Department approved conservation restriction for the mitigation site (http://www.state.nj.us/dep/landuse/forms/index.html). The restriction shall be included on the deed, and recorded in the office of the County Clerk (the Registrar of Deeds and Mortgages in some counties), in the county wherein the lands of the mitigation project are located, within 10 days of approval of the wetland mitigation proposal. Immediately following the filing of the conservation restriction a copy must be sent to the Division for verification.

6. The permittee shall notify the Division of Land Use Regulation, in writing, at least thirty (30) days in advance of the start of construction of the wetland mitigation project for an on-site pre-construction meeting between the permittee, the contractor, the consultant and the Division.

7. The mitigation designer must be present during critical stages of construction of the mitigation project to ensure the intent of the mitigation design and its predicted wetland hydrology is realized in the landscape. Mitigation designs are not static documents and changes may be necessary to ensure success of the project. It shall be the prerogative of the mitigation consultant to make changes to the design should field conditions warrant such action.

8. Immediately following the final grading of the mitigation site, the permittee shall notify the Division for a post-grading construction meeting between the permittee, contractor, consultant and the Division. The permittee must give the Division at least thirty (30) days notice prior to the date of this meeting.

9. Within 30 days following the final grading of the mitigation project, the permittee shall submit a final report to the Division of Land Use Regulation. For intertidal subtidal shallows creation, the final report shall contain the following information:

   a. A completed WETLAND MITIGATION PROJECT COMPLETION OF CONSTRUCTION FORM (http://www.state.nj.us/dep/landuse/forms/index.html) which certifies that the mitigation project has been constructed as designed and that the proposed area of mitigation has been accomplished;

   b. As built plans with surroundings demonstrating that the site was graded according to the approved mitigation plans.

   c. If intertidal subtidal shallows were created, documentation demonstrating that the mitigation site meets the definition of an intertidal subtidal shallow, that it is permanently or twice daily submerged from the Spring high tide to a depth of four feet below mean low water.

For wetlands enhancement or other components of the mitigation plan, the final report shall contain, at a minimum, the following information:

d. A completed WETLAND MITIGATION PROJECT COMPLETION OF CONSTRUCTION FORM (attached) which certifies that the mitigation project has been constructed as designed and that the proposed area of wetland creation, restoration or enhancement has been accomplished;

e. As built plans which depict final grade elevations at one foot contours and include a table of the species and quantities of vegetation that were planted including any grasses that may have been used for soil stabilization purposes;

f. Show on the as-built plans that the boundaries of the wetland mitigation area has been visibly marked with 3 inch white PVC pipe extending 4 feet above the ground surface. The stakes must remain on the site for the entire monitoring period;

g. Photos of the constructed wetland mitigation project with a photo location map as well as the GPS waypoints in NJ state plane coordinates NAD 1983;

h. To document that the required amount of soil has been placed/replaced over the entire area of the mitigation site, provide a minimum of 6 soil profile descriptions to a depth of 20 inches. The location of each soil profile description should be depicted on the as built plan as well as provide the GPS waypoints in NJ state plane coordinates NAD 1983;

i. Submit soil test results demonstrating at least 8% organic carbon content (by weight) was incorporated into the A-horizon for sandy soil and for all other soil types 12% organic content or if manmade top soil was used it consisted of equal volumes of organic and mineral materials;

j. The permittee shall post the mitigation area with several permanent signs, which identify the site as a wetland mitigation project and that mowing, cutting, dumping and draining of the property is prohibited; and

k. The sign must also state the name of the permittee, Department's permit number along with a contact name and phone number.

10. If the Program determines that one or more of the conditions regarding intertidal subtidal mitigation listed at 9 above are not satisfied, then the post construction monitoring shall be repeated the following lunar month(s) until all conditions regarding intertidal subtidal shallows at 9 above are met.

11. The permittee shall monitor the mitigation project for a lunar month after construction for the intertidal subtidal portion of the mitigation project. The permittee shall monitor the mitigation project for 5 full growing seasons if it is a proposed forested or scrub/shrub wetland and 3 full growing seasons for an emergent wetland or State open water after the mitigation project has been constructed.

12. The permittee shall submit a monitoring report to the Division of Land Use Regulation no later than December 31 of each monitoring year.

13. The monitoring report will include all the following information for the intertidal subtidal shallows portion of the project:

a. A USGS quad map showing the location of the mitigation site; a county road map showing the location (including lot and block) of the mitigation site; copy of an aerial photograph of the

mitigation site. The point(s) of access to the mitigation site must be clearly indicated on all maps;

b. A copy of the permit the required the mitigation;

c. A brief description of the mitigation;

d. Photographs of the mitigation site with a location map indicating the location and direction for each photograph and indicating the tidal stage at the time the photo was taken;

e. For mitigation projects establishing a vegetative community, an assessment of the planted vegetation and any species that are naturally colonizing the site. This assessment shall include data sheets from the sampling points which describe the vegetation present, the percent coverage of the vegetation and the location of the water table;

f. Based on the approved water budget prepared in accordance with N.J.A.C 7:7E-3B.2(a)7, documentation demonstrating that the mitigation site is a wetland or intertidal or subtidal shallows. The documentation shall include, as appropriate, monitoring well data, stream gauge date, photographs and/or field observation notes collected throughout the post-construction monitoring period;

g. Documentation, based on field data, that the approved goals of the mitigation project prepared pursuant to N.J.A.C. 7:7E-3B.2(a), are satisfied;

h. A narrative evaluating the success/failure of the project in accordance with N.J.A.C. 7:7:E-3B.5;

i. In the event that the mitigation is a failure in accordance with N.J.A.C. 7:7:E-3B.5, a narrative description of proposed actions that will permanently rectify the problems.

14. All monitoring reports will include all the following information for the non-intertidal subtidal shallows portions of the project (see attached monitoring report checklist):

j. All monitoring reports except the final one must include documentation that it is anticipated, based on field data, that the goals of the wetland mitigation project including the transition area, as stated in the approved wetland mitigation proposal and the permit will be satisfied. If the permittee is finding problems with the mitigation project and does not anticipate the site will be a full success then recommendations on how to rectify the problems must be included in the report with a time frame in which they will be completed;

k. All monitoring reports except the final one must include field data to document that the site is progressing towards 85 percent survival and 85 percent area coverage of mitigation plantings or target hydrophytes (Target hydrophytes are non-invasive native species to the area and similar to ones identified on the mitigation planting plan). If the proposed plant community is a scrub/shrub or a forested wetland the permittee must also demonstrate each year with data that the woody species are thriving, increasing in stem density and height each year. If the field data shows that the mitigation project is failing to meet the vegetation survival, coverage and health goals, the monitoring report should contain a discussion of steps that will be taken to rectify the problem, including a schedule of implementation;

l. All monitoring reports except the final one must include documentation of any invasive or noxious species (see below for list of species) colonizing the site and how they are being eliminated. The permittee is required to eliminate either through hand-pulling, application of a

pesticide or other Department approved method any occurrence of an invasive/noxious species on the mitigation site during the monitoring period;

m. All monitoring reports except the final one must include documentation that demonstrates the proposed hydrologic regime as specified in the mitigation proposal appears to be met. If the permittee is finding problems with the mitigation project and does not anticipate the proposed hydrologic regime will be or has not been met then recommendations on how to rectify the problem must be included in the report along with a time frame within which it will be completed;

n. The final monitoring report must include documentation to demonstrate that the goals of the wetland mitigation project including the required transition area, as stated in the approved wetland mitigation proposal and the permit, has been satisfied. Documentation for this report will also include a field wetland delineation of the wetland mitigation project based on techniques as specified in the Federal Manual for Identifying and Delineating Jurisdictional Wetlands (1989);

o. The final monitoring report must include documentation the site has an 85 percent survival and 85 percent area coverage of the mitigation plantings or target hydrophytes. The permittee must also document that all plant species are healthy and thriving and if the proposed plant community contains trees demonstrate that the trees are at least five feet in height;

p. The final monitoring report must include documentation demonstrating the site is less than 10 percent occupied by invasive or noxious species such as but not limited to *Phalaris arundinacea* (Reed canary grass), *Phragmities australis* (Common reed grass), *Pueraria lobata* (Kudzu), *Typha latifloia* (Broad-leaved cattail), *Typha angustifolia* (Narrowed leaved cattail), *Lythrum salicaria* (Purple loosestrife), *Ailanthus altissima* (Tree-of-heaven), *Berberis thunbergi* (Japanese barberry), *Berberis vulgaris* (Common barberry), *Elaeagnus angustifloia* (Russian olive), *Elaeagnus umbellata* (Autumn olive), *Ligustrum obtusifolium* (Japanese privet), *Ligustrum vulgare* (Common privet) and *Rosa multiforia* (Multiflora rose);

q. The final monitoring report must include documentation that demonstrates that the proposed hydrologic regime as specified in the mitigation proposal, which proves the mitigation site is a wetland has been satisfied. The documentation shall include when appropriate monitoring well data, stream gauge data, photographs and field observation notes collected throughout the monitoring period; and

r. The final monitoring report must include documentation that the site contains hydric soils or there is evidence of reduction occurring in the soil throughout the delineated wetlands.

15. The permittee shall assume all liability for accomplishing corrective work should the Program determine that the compensatory mitigation has not been 100% satisfactory. Remedial work may include re-grading and/or replanting the mitigation site. This responsibility is incumbent upon the permittee until such time that the Department makes the finding that the mitigation project is successful.

16. If the permittee fails to perform mitigation within the applicable time period the acreage of mitigation required shall be increased by 20% each year after the date mitigation was to begin.

Project Specific Conditions

17. Prior to the commencement of any regulated activity within the tidal floodplain of the Hackensack River, the permittee shall obtain a Flood Hazard Area Individual Permit from the Division of Land Use Regulation.

18. Prior to the commencement of any regulated activity within the project area, the permittee shall conduct a survey within the wetland areas subject to impacts by this project to ensure that no breeding herons are within the work area. The survey shall be submitted to the Division for review and approval.

19. Prior to the commencement of any regulated activity outside the existing rail right-of-way, all necessary Federal, State and local approvals, including Coast Guard and U.S. Army Corps of Engineers must be obtained by the permittee for the acquisition of land associated with this project.

20. Prior to the commencement of any regulated activity associated with the disturbance of known contaminated soils, the permittee shall obtain approvals from the Department's Site Remediation Program.

21. Prior to the commencement of any regulated activity associated with this project, the permittee shall submit a detailed waterfront walkway design plan to the Division for review and approval. The waterfront walkway design plan shall consist of a public waterfront walkway along the Hackensack River that conform with the requirements set forth at the Coastal Zone Management Rule, N.J.A.C. 7:7E-8.11(e), Public Trust Rights.

22. Construction within the Hackensack River and within 50 feet from the top of the bank that could potentially introduce sediment into the river shall be prohibited from April 1 to June 30 in order to protect the anadromous game fishery resource, except within completed coffer dams.

23. Prior to any construction activities, the permitee shall submit to the Division for review and approval a plan to avoid or minimize adverse effects to archaeological and architectural resources within the project area.

24. Prior to any construction activities, the permittee must obtain the necessary tidelands conveyances from the Division's Bureau of Tidelands Management.

25. Heavy duty silt fence with wire backing shall be used to encompass work activities on land and shallow water areas. Open water areas of construction shall be encompassed by floating turbidity barriers.

26. Prior to construction activities, the permitee is required to provide the following: 1) measures to prevent falling material from entering the water during construction. 2) turbidity silt barriers curtains will be placed along all work areas, the barrier shall not restrict the water flow to the waterway by maintaining an opening at least 50% of the channel width.

27. All excavated materials must be disposed of at an appropriate site. Under no circumstances is excess material to be disposed of in wetlands, transition areas to wetlands, stream corridors or other environmentally sensitive areas.

28. Raw uncured concrete is toxic to fish and other aquatic organisms and must not come into contact with the Hackensack River.

Thank you for your attention to and cooperation with New Jersey's Coastal Zone Management Program. If you have any questions with regard to this determination, please do not hesitate to contact Charlie Welch of my staff by e-mal at charlie.welch@dep.state.nj.us or at 609-777-0454.

EXECUTIVE SUMMARY

CERCLIS-NFRAP: Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

A review of the CERC-NFRAP list, as provided by EDR, and dated 12/20/2006 has revealed that there are 16 CERC-NFRAP sites within the searched area.

EXECUTIVE SUMMARY

RCRAInfo: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. RCRAInfo replaces the data recording and reporting abilities of the Resource Conservation and Recovery Information System(RCRIS). The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month. Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month Large quantity generators generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month. Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

A review of the RCRA-TSDF list, as provided by EDR, and dated 06/13/2006 has revealed that there are 13 RCRA-TSDF sites within the searched area.

INST CONTROLS: A listing of sites with institutional controls in place. Institutional controls include administrative measures, such as groundwater use restrictions, construction restrictions, property use restrictions, and post remediation care requirements intended to prevent exposure to contaminants remaining on site. Deed restrictions are generally required as part of the institutional controls.

A review of the US INST CONTROL list, as provided by EDR, and dated 01/24/2007 has revealed that there is 1 US INST CONTROL site within the searched area.

TSCA: The Toxic Substances Control Act identifies manufacturers and importers of chemical substances included on the TSCA Chemical Substance Inventory list. It includes data on the production volume of these substances by plant site. The United States Environmental Protection Agency has no current plan to update and/or re-issue this database.

A review of the TSCA list, as provided by EDR, and dated 12/31/2002 has revealed that there are 6 TSCA sites within the searched area.

SSTS: Section 7 of the Federal Insecticide, Fungicide and Rodenticide Act, as amended (92 Stat. 829) requires all registered pesticide-producing establishments to submit a report to the Environmental Protection Agency by March 1st each year. Each establishment must report the types and amounts of pesticides, active ingredients and devices being produced, and those having been produced and sold or distributed in the past year.

A review of the SSTS list, as provided by EDR, and dated 12/31/2004 has revealed that there are 3 SSTS sites within the searched area.

EXECUTIVE SUMMARY

ENGG CONTROL: Legal Document that restricts the use of contaminated property; holds owner(s) to the regulatory/statutory requirements for cleanup.

A review of the ENG CONTROLS list, as provided by EDR, and dated 12/28/2006 has revealed that there are 6 ENG CONTROLS sites within the searched area.

ISRA: The ISRA process begins with determining if the Act applies to your type of business and transaction. The provisions of ISRA only apply to industrial establishments. What is an industrial establishment? The term "industrial establishment" refers to the type of business operations and transactions that would subject a facility to review under ISRA. An industrial establishment must meet each of the following three criteria: The place of business or real property at which such business is conducted, having a North American Industry Classification System (NAICS) code listed in N.J.A.C. 7:26 B - Appendix C subject to the specified exceptions and limitations. The place of business must have been engaged in operations on or after December 31, 1983; and The place of business must involve the generation, manufacture, refining, transportation, treatment, storage, handling, or disposal of hazardous substances or hazardous wastes.

A review of the ISRA list, as provided by EDR, and dated 01/29/2007 has revealed that there are 14 ISRA sites within the searched area.

HWS RE-EVAL: The locations were removed from the Known Contaminated Sites list for a variety of reasons. Some of the sites were taken off the list because they were inactive, some were not assigned a case worker and some were no longer contaminated. Inspectors from the DEP are now undertaking a full re-evaluation of each of the locations statewide. That includes visual and environmental tests to see whether contamination still exists.

A review of the HWS RE-EVAL list, as provided by EDR, and dated 08/15/2006 has revealed that there are 4 HWS RE-EVAL sites within the searched area.

AFS (Aerometric Information Retrieval System (AIRS) Facility

NJDEP @ SYNCON RESINS INC (Continued) **1000179652**

Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

CERCLIS (Comprehensive Environmental Response, Compensation, and Liability Information System) is the Superfund database that is used to support management in all phases of the Superfund program. The system contains information on all aspects of hazardous waste sites, including an inventory of sites, planned and actual site activities, and financial information.

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and its Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

NJ-NJEMS (New Jersey - New Jersey Environmental Management System). The Department of Environmental Protection (NJDEP) manages large databases of environmental information in this integrated system.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Summary Details:

Conditions at listing July 1982): Syncon Resins once manufactured paints, varnishes, and resins on a 5-acre site in South Kearny, Hudson County, New Jersey. The company closed in 1981 and declared bankruptcy. The site is situated within acoastal wetlands management area and is bordered on the west by the Passaic River, a tidal waterway. About 11,000 55-gallon drums are stored in warehouses and also in the open on the ground. Analysis indicates that many drums contain ha ardoussubstances. Many are volatile and flammable, posing the threat of air pollution and fire. Some drums have rusted, spilling their contents onto the soil. Several bulk storage tanks suspected of containing ha ardous substances are also on the site. Two unlined ponds used for subsurface disposal of process waste contain ha ardous organics. A large amount of soil is contaminated, and ground water is contaminated with organic chemicals, including ben ene, PCBs, and toluene. Status July 1983): In December 1982, EPA awarded a 2,115,000 Cooperative Agreement to New Jersey for 1) an initial remedial measure involving removal of surface drums and 2) a long-term feasibility study to fill any gaps in the information on ground water and to identify alternatives for remedial action at the site. The work is scheduled to be completed in the first quarter of 1984.

Site Description: Syncon Resins manufactured paint, varnish and resins at this site until 1982. It is located in a coastal management area and borders the Passaic River. The facility consisted of 13 buildings, numerous large storage vessels and tanks and two unlined wastewater lagoons. At the time operations ceased, approximately 13,000 55-gallon drums of various chemicals were being stored at the site, most of which were in poor condition and leaking. USEPA added the Syncon Resins facility to the National Priorities List of Superfund sites (NPL) in 1983. The following year NJDEP implemented an Interim Remedial Measure (IRM) to remove and dispose of all of the drums. Between 1984 and 1986, NJDEP conducted a Remedial Investigation and Feasibility Study (RI/FS) that revealed extensive contamination in the soil, ground water and building, and large volumes of liquid and solid chemical wastes in the various storage vessels and tanks at the site. USEPA issued a Record of Decision (ROD) with NJDEP concurrence in 1986 that required the following remedial actions: 1) removal of the lagoon liquids and sediments and the contents of the storage vessels and tanks; 2) excavation and disposal of the grossly contaminated soil and decontamination of the buildingsand other site structures; 3) installation of an on-site remediation system to extract and treat the contaminated ground water; and 4) treatment of residual soil contamination by soil flushing. In 1989, NJDEP conducted a second IRM to remove thousands of small containers of chemicals from the on-site laboratory and initiated the remedial actions specified in the ROD. By 1992, NJDEP had removed the lagoon liquids and other wastes from the site, decontaminated the buildings and tanks, excavated and removed the grossly contaminated soil and completed construction of a soil flushing/ground water treatment system. These actions were subsequently designated Operable Unit 1 (OU1). While operation of the soil flushing/ground water treatment systemwas underway, NJDEP conducted supplemental studies that revealed highly contaminated soil and ground water at the southwestern portion of the plant were not being adequately addressed by the existing system. In 2000, USEPA issued a ROD for the southwestern portion of the site, which was designated OU2. The ROD requires excavation of approximately 30,000 cubic yards of heavily contaminated soil from a 2.5 acre area, followed by treatment and disposal of drained free product from the soil, improvement of the subsurface drainage at the southwestern portion of the site, and backfilling the excavation with the drained soil after nutrients have been added to enhance biodegradation of the residual organic contaminants. These actions are expected to significantly improve the effectiveness of the soil flushing/ground water treatment system and expedite cleanup of the site. The ROD also requires establishment of a Deed Notice or other institutional controls to ensure that the property is used for industrial or commercial purposes only. NJDEP begin the Remedial Design for the OU2 remedial action in late 2003.

FINDS:
Other Pertinent Environmental Activity Identified at Site

CERCLIS (Comprehensive Environmental Response, Compensation, and Liability Information System) is the Superfund database that is used to support management in all phases of the Superfund program. The system contains information on all aspects of hazardous waste sites, including an inventory of sites, planned and actual site activities, and financial information.

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and its Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

NJ-NJEMS (New Jersey - New Jersey Environmental Management System). The Department of Environmental Protection (NJDEP) manages large databases of environmental information in this integrated system.

Summary Details:

Conditions at listing September 1983): The Diamond Alkali Co. Site occupies about I acre immediately adjacent to the Passaic River, in Newark, Essex County, New Jersey. From 1943 through l968, the company manufactured numerous chemicals onthe site, including 2,4,5-trichlorophenol, which is likely to contain dioxin as an impurity. Extensive sampling conducted by EPA and the State has detected extremely high concentrations of dioxin on and off the site. EPA and the State have covered the area of major contamination with plastic tarpaulins. Adjacent transportation routes and residential areas were swept and vacuumed. Workers may have been exposed to dioxin during normal operations, as well as during renovations conducted during the summer of l982. Another company has since purchased the land. The area is both densely populated and heavily industriali ed. Municipal water is drawn from the Wanaque Reservoir, roughly 35 miles from the site. Status June 1984): On March 13, 1984, the State and Diamond entered into an Administrative Order on Consent for a remedial investigation/feasibility study and for on-site cleanup.

Site Status Details:

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Other Pertinent Environmental Activity Identified at Site

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and its Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

NCDB (National Compliance Data Base) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Toxic Substances Control Act (TSCA). The system tracks inspections in regions and states with cooperative agreements, enforcement actions, and settlements.

BETTER METHODS (Continued) **1000400631**

NJ-NJEMS (New Jersey - New Jersey Environmental Management System). The Department of Environmental Protection (NJDEP) manages large databases of environmental information in this integrated system.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

NJ-NJEMS (New Jersey - New Jersey Environmental Management System). The Department of Environmental Protection (NJDEP) manages large databases of environmental information in this integrated system.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

FINDS:
Other Pertinent Environmental Activity Identified at Site

CERCLIS (Comprehensive Environmental Response, Compensation, and Liability Information System) is the Superfund database that is used to support management in all phases of the Superfund program. The system contains information on all aspects of hazardous waste sites, including an inventory of sites, planned and actual site activities, and financial information.

NJ-NJEMS (New Jersey - New Jersey Environmental Management System). The Department of Environmental Protection (NJDEP) manages large databases of environmental information in this integrated system.

Other Pertinent Environmental Activity Identified at Site

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

CERCLIS (Comprehensive Environmental Response, Compensation, and Liability Information System) is the Superfund database that is used to support management in all phases of the Superfund program. The system contains information on all aspects of hazardous waste sites, including an inventory of sites, planned and actual site activities, and financial information.

NCDB (National Compliance Data Base) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Toxic Substances Control Act (TSCA). The system tracks inspections in regions and states with cooperative agreements, enforcement actions, and settlements.

NJ-NJEMS (New Jersey - New Jersey Environmental Management System). The Department of Environmental Protection (NJDEP) manages large databases of environmental information in this integrated system.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport,

STD CHLORINE CHEM/CLOROBEN CHEM CORP (Continued) **1000310279**

and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

Other Pertinent Environmental Activity Identified at Site

NJ-NJEMS (New Jersey - New Jersey Environmental Management System). The Department of Environmental Protection (NJDEP) manages large databases of environmental information in this integrated system.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Other Pertinent Environmental Activity Identified at Site

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and its Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

NCDB (National Compliance Data Base) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Toxic Substances Control Act (TSCA). The system tracks inspections in regions and states with cooperative agreements, enforcement actions, and settlements.

NJ-NJEMS (New Jersey - New Jersey Environmental Management System). The Department of Environmental Protection (NJDEP) manages large databases of environmental information in this integrated system.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and its Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

NCDB (National Compliance Data Base) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Toxic Substances Control Act (TSCA). The system tracks inspections in regions and states with cooperative agreements, enforcement actions, and settlements.

The NEI (National Emissions Inventory) database contains information on stationary and mobile sources that emit criteria air pollutants and their precursors, as well as hazardous air pollutants (HAPs).

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for

G & S MOTOR EQUIPMENT CO (Continued) **1000309856**

information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and its Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

NCDB (National Compliance Data Base) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Toxic Substances Control Act (TSCA). The system tracks inspections in regions and states with cooperative agreements, enforcement actions, and settlements.

NJ-NJEMS (New Jersey - New Jersey Environmental Management System). The Department of Environmental Protection (NJDEP) manages large databases of environmental information in this integrated system.

PCS (Permit Compliance System) is a computerized management information system that contains data on National Pollutant Discharge Elimination System (NPDES) permit holding facilities. PCS tracks the permit, compliance, and enforcement status of NPDES facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Site Description: This site, also known as the MSLA 1-D Landfill, is located in a wetlands area near the Passaic River and Exit 15W of the New Jersey Turnpike. The Municipal Sanitary Landfill Authority (MSLA) operated the landfill during the late 1970s and early 1980s. Records indicate that in addition to municipal waste, approximately 1.5 million gallons of waste oil were deposited there. Various industrial wastes were also reportedly disposed of in the landfill, including pharmaceuticals, sewage sludges, asphalt sludges and insecticides. NJDEP ordered the landfill to cease operations in 1982 because it reached maximum allowable height and MSLA had failed to maintain the leachate collection system. A soil cover was placed over the landfill at the time of closure but the site was never properly capped or maintained. Since disposal operations ceased, large volumes of leachate have routinely discharged from the landfill into the surrounding wetlands and the Passaic River. A private company installed a landfill gas recovery system at the site in 1989 to capture the methane gas being generated by the waste fill for use as an energy source. USEPA conducted a limited remedial investigation at the site in 1990 that revealed the soil, ground water, surface water and sediments at and near the landfill were contaminated with a variety of organic and inorganic compounds and metals. NJDEP's Remedial Response Element plans to implement closure actions at this site to prevent the release of methane from the waste fill and mitigate the impact of landfill leachate on the environment. NJDEP is conducting a Remedial Design for the following landfill closure measures: 1) installation of a subsurface containment wall and leachate collection system to prevent leachate-contaminated ground water from discharging to the surrounding areas; and 2) installation of a solid waste-type impermeable cap to prevent infiltration of precipitation and thereby minimize the generation of additional leachate. NJDEP expects to complete the Remedial Design for the landfill closure measures in 2004. NJDEP has also provided funding for the Kearny Municipal Utilities Authority to design a pump station and force main to convey leachate from the landfill to a sewage treatment plant for disposal.

RCRAInfo is a national information system that supports the Resource

GOODY PRODUCTS INCORPORATED (Continued) **1000193803**

Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

Other Pertinent Environmental Activity Identified at Site

NJ-NJEMS (New Jersey - New Jersey Environmental Management System). The Department of Environmental Protection (NJDEP) manages large databases of environmental information in this integrated system.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Other Pertinent Environmental Activity Identified at Site

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and its Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

NJ-NJEMS (New Jersey - New Jersey Environmental Management System). The Department of Environmental Protection (NJDEP) manages large databases of environmental information in this integrated system.

PCS (Permit Compliance System) is a computerized management information system that contains data on National Pollutant Discharge Elimination System (NPDES) permit holding facilities. PCS tracks the permit, compliance, and enforcement status of NPDES facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the

PATCO CHEMICAL INDUSTRIES. (Continued) **1005594444**

estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

Other Pertinent Environmental Activity Identified at Site

CERCLIS (Comprehensive Environmental Response, Compensation, and Liability Information System) is the Superfund database that is used to support management in all phases of the Superfund program. The system contains information on all aspects of hazardous waste sites, including an inventory of sites, planned and actual site activities, and financial information.

NJ-NJEMS (New Jersey - New Jersey Environmental Management System). The Department of Environmental Protection (NJDEP) manages large databases of environmental information in this integrated system.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Summary Details:

Conditions at Proposal July 27, 2000): The Diamond Head Oil Refinery Div. Diamond Head) site is located at 1401 Harrison Ave. in Kearny, Hudson County, New Jersey. Currently, the site is inactive and consists of undeveloped land that is borderedby Harrison Avenue to the north, entrance ramp M of Interstate 280 I-280) to the east, I-280 to the south, and Campbell Distribution Foundry to the west. The site is comprised of wetland areas and drainage ditches, a small wetland/pond, a vegetated landfill area along the western border of the site, and the remnants of the former Diamond Head Oil Refinery on the eastern portion of the site. The abandoned refinery portion of the site contains various construction debris, including foundations of the former on-site building and two former aboveground storage tanks. The refinery is currently owned by the Hudson Meadows Urban Land Development Corporation HMULDC). A

DIAMOND HEAD OIL REFINERY DIV. (Continued) **1000301183**

portion of the site is owned by HMULDC. The Diamond Head Oil Refinery Div. was in operation from February 1, 1946 to early 1979. The facility operated under several company names including PSC Resources, Inc., Ag-Met Oil Service, Inc., and Newtown Refining Corporation. All of these companies were owned by Mr. Robert Mahler. In January 1985, Newtown Refining Corporation sold the property to Mimi Urban Development Corporation, which changed its name to Hudson Meadows Urban Land Development Corporation. During facility operations, two aboveground storage tanks and possibly underground pits were used to store oily wastes. These wastes were intermittently discharged directly to adjacent properties, including the wetland area to the south of the site, creating an oil lake. The New Jersey Department of Transportation NJDOT) acquired the property south of the refinery on March 6, 1968. In 1977, NJDOT began construction of I-280 and was reported to have removed 9 million gallons of oil- contaminated water and 200,000 to 250,000 cubic yards of oily sludge from the lake. The material was reportedly transported to Newtown Refining Corporation s facility on Long Island to be recycled; however, there are no reports stating that this recycling process occurred. It is also reported that during the construction of I-280, an underground lake of oil-contaminated ground water was found extending from the eastern limits of the NJDOT right-of-way to Frank s Creek on the west. It is reported that, prior to abandoning the refinery, Diamond Head cleaned out the two aboveground tanks; however, there is no known documentation of this activity. From the close of operations in 1979 until 1982, the abandoned refinery was not completely fenced. During this time, it was reported that dumpingof waste oils and other debris took place on site. Refinement International Co. hired Eastern Chemical Co. to clean up the refinery in May 1982. In order to do so, the material in the tanks was analy ed and found to contain polychlorinated biphenyls PCBs) at a concentration of 206 parts per million ppm). Subsequent analyses revealed the presence of PCBs at concentrations over 3,100 ppm. Approximately 7,500 gallons of material were pumped out of the tanks and disposed off site by a Resource Conservation and Recovery Act RCRA) permitted Treatment, Storage, and Disposal Facility TSDF) by Resource Technology Service. Environmental Transport also removed 27 tons of contaminated soil in May 1982. Background information indicatesthat previous investigations have been conducted at the Diamond Head Oil Refinery Div. site. These investigations include a sampling event conducted by the New Jersey Department of Environmental Protection NJDEP), an Environmental Site Characteriation conducted by Killam Associates, and a Site Inspection conducted by the U.S. Environmental Protection Agency EPA) Region II Field Investigation Team FIT). During these investigations, ground water, surface water/sediment, surface/subsurfacesoil, liquid waste and solid waste samples were collected. Analytical results of these samples indicated the presence of volatile organic compounds VOCs), and semivolatile organic compounds SVOCs), pesticides, PCBs, and metals. In December1999 EPA conducted an Expanded Site Inspection ESI) at the Diamond Head Oil Refinery Div. site. During the ESI, EPA collected surface/subsurface soil and ground water samples from 20 borings advanced throughout the site. EPA also collected sediment samples from the on-site wetland/pond area as well as from the wetland area extending along the southern perimeter of the site. Analytical results indicated the presence of VOCs, SVOCs, pesticides, PCBs, and metals. An observed release to surface water is documented by chemical analyses of sediment samples collected from wetlands along the southern and western boundaries of the site. Level II concentration of lead and inc are documented to 0.19 mile of wetland frontage located along thesouthern perimeter of the site. Status September 2002): EPA is considering various alternatives for this site. The description of the site release) is based on information available at the time the site was evaluated with the HRS. The description may change as additional information

DIAMOND HEAD OIL REFINERY DIV. (Continued) **1000301183**

is gathered on the sources and extent of contamination. See 56 FR 5600, February 11, 1991, or subsequent FR notices. For more information about the ha ardous substances identified in this narrative summary, including general information regarding the effects of exposure to these substances on human health, please see the Agency for Toxic Substances and Disease Registry ATSDR) ToxFAQs. ATSDR ToxFAQs can be found on the Internet at http://www.atsdr.cdc.gov/toxfaq.html or by telephone at 1- 888-42-ATSDR or 1-888-422-8737.

Other Pertinent Environmental Activity Identified at Site

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

FRP

The NEI (National Emissions Inventory) database contains information on stationary and mobile sources that emit criteria air pollutants and their precursors, as well as hazardous air pollutants (HAPs).

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and its Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate

OWENS CORNING (Continued) **1000319024**

that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

NJ-NJEMS (New Jersey - New Jersey Environmental Management System). The Department of Environmental Protection (NJDEP) manages large databases of environmental information in this integrated system.

PCS (Permit Compliance System) is a computerized management information system that contains data on National Pollutant Discharge Elimination System (NPDES) permit holding facilities. PCS tracks the permit, compliance, and enforcement status of NPDES facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

Site Description: This site has a history of landfilling activities dating back to 1951. The most recent operator, V. Ottilio & Sons, conducted landfilling under a state permit between 1975 and 1979. Materials disposed of in the landfill consisted mainly of construction debris; however, illegal dumping is suspected to have occurred prior to and throughout the Ottilio operation. Oil has been observed in drainage ditches and ponds at the site and an unknown number of chemical drums were disposed of at the property. NJDEP's Remedial Response Element conducted a Remedial Investigation/Remedial Action Selection (RI/RAS) that revealed the ground water, surface water, subsurface soil and sediments at the site were contaminated with organic and inorganic compounds.Based on these findings, NJDEP issued a Decision Document in 1996 that required installation of a landfill cap, a landfill gas collection/venting system and leachate collection system, as well as excavation of contaminated drainage ditch sediments and long-term monitoring of the ground water. NJDEP completed the Remedial Design for the landfill cap, landfill gas collection/venting system and leachate collection system in 2002 and construction of the remedial measures is underway. Construction activities are expected to be completed in 2004.
Property Size: 5 Acres
Surrounding Land Use: Commercial/Industrial

Violation Status: No violations found

FINDS:
Other Pertinent Environmental Activity Identified at Site

PCS (Permit Compliance System) is a computerized management information system that contains data on National Pollutant Discharge Elimination System (NPDES) permit holding facilities. PCS tracks the permit, compliance, and enforcement status of NPDES facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

FINDS:
Other Pertinent Environmental Activity Identified at Site

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

CERCLIS (Comprehensive Environmental Response, Compensation, and Liability Information System) is the Superfund database that is used to support management in all phases of the Superfund program. The system contains information on all aspects of hazardous waste sites, including an inventory of sites, planned and actual site activities, and financial information.

NCDB (National Compliance Data Base) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Toxic Substances Control Act (TSCA). The system tracks inspections in regions and states with cooperative agreements, enforcement actions, and settlements.

The NEI (National Emissions Inventory) database contains information on stationary and mobile sources that emit criteria air pollutants and their precursors, as well as hazardous air pollutants (HAPs).

NJ-NJEMS (New Jersey - New Jersey Environmental Management System). The Department of Environmental Protection (NJDEP) manages large databases of environmental information in this integrated system.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of

NORPAK CORP (Continued) **1000345058**

events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

NJ-NJEMS (New Jersey - New Jersey Environmental Management System). The Department of Environmental Protection (NJDEP) manages large databases of environmental information in this integrated system.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Other Pertinent Environmental Activity Identified at Site

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

CERCLIS (Comprehensive Environmental Response, Compensation, and Liability Information System) is the Superfund database that is used to support management in all phases of the Superfund program. The system contains information on all aspects of hazardous waste sites, including an inventory of sites, planned and actual site activities, and financial information.

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and

FAIRMOUNT CHEMICAL CO INC (Continued) **1000365101**

its Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

NCDB (National Compliance Data Base) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Toxic Substances Control Act (TSCA). The system tracks inspections in regions and states with cooperative agreements, enforcement actions, and settlements.

The NEI (National Emissions Inventory) database contains information on stationary and mobile sources that emit criteria air pollutants and their precursors, as well as hazardous air pollutants (HAPs).

NJ-NJEMS (New Jersey - New Jersey Environmental Management System). The Department of Environmental Protection (NJDEP) manages large databases of environmental information in this integrated system.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

Investigation Type: EPCRA, Data Quality, Federal Conducted
Investigation Reason: Neutral Scheme, Region
Legislation Code: EPCRA
Facility Function: Manufacturer

Inspection Number: 1996062010774 2
Region: 02
Inspection Date: 06/20/1996
Inspector: L. PAPPALARDO, TB
Violation occurred: No
Investigation Type: Section 13 Importer Inspection
Investigation Reason: Neutral Scheme, Region
Legislation Code: TSCA
Facility Function: Manufacturer/Importer

Inspection Number: 1996062010774 3
Region: 02
Inspection Date: 06/20/1996
Inspector: L. PAPPALARDO, TB
Violation occurred: No
Investigation Type: Section 12 Export
Investigation Reason: Neutral Scheme, Region
Legislation Code: TSCA
Facility Function: Manufacturer/Importer

Inspection Number: 1996062010774 5
Region: 02
Inspection Date: 06/20/1996
Inspector: L. PAPPALARDO, TB
Violation occurred: No
Investigation Type: Section 5 Premanufacture Notice
Investigation Reason: Neutral Scheme, Region
Legislation Code: TSCA
Facility Function: Manufacturer/Importer

Inspection Number: 1996062010774 4
Region: 02
Inspection Date: 06/20/1996
Inspector: L. PAPPALARDO, TB
Violation occurred: No
Investigation Type: Section 5 Inspections
Investigation Reason: Neutral Scheme, Region
Legislation Code: TSCA
Facility Function: Manufacturer/Importer

Inspection Number: 199312215211 1
Region: 02
Inspection Date: 12/21/1993
Inspector: J.R. OLECHOWSKI, AJM

FAIRMOUNT CHEMICAL CO, INC (Continued) **1009514321**

Violation occurred: No
Investigation Type: Section 5 (E) of (F) Order
Investigation Reason: Neutral Scheme, Region
Legislation Code: TSCA
Facility Function: Manufacturer

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Other Pertinent Environmental Activity Identified at Site

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and its Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

NCDB (National Compliance Data Base) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Toxic Substances Control Act (TSCA). The system tracks inspections in regions and states with cooperative agreements, enforcement actions, and settlements.

NJ-NJEMS (New Jersey - New Jersey Environmental Management System). The Department of Environmental Protection (NJDEP) manages large databases of environmental information in this integrated system.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are

ROSE COLOR INC (Continued) **1000911682**

transported off-site.

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

NCDB (National Compliance Data Base) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Toxic Substances Control Act (TSCA). The system tracks inspections in regions and states with cooperative agreements, enforcement actions, and settlements.

NJ-NJEMS (New Jersey - New Jersey Environmental Management System). The Department of Environmental Protection (NJDEP) manages large databases of environmental information in this integrated system.

TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

NJ-NJEMS (New Jersey - New Jersey Environmental Management System). The Department of Environmental Protection (NJDEP) manages large databases of environmental information in this integrated system.

NCDB (National Compliance Data Base) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Toxic Substances Control Act (TSCA). The system tracks inspections in regions and states with cooperative agreements, enforcement actions, and settlements.

NJ-NJEMS (New Jersey - New Jersey Environmental Management System). The Department of Environmental Protection (NJDEP) manages large databases of environmental information in this integrated system.

RCRAInfo is a national information system that supports the Resource

HILTON DAVIS CHEMICAL CO (Continued) **1000416249**

Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V

FISKE BROTHERS REFINING CO (Continued) **1000268150**

of the Clean Air Act.

NJ-NJEMS (New Jersey - New Jersey Environmental Management System). The Department of Environmental Protection (NJDEP) manages large databases of environmental information in this integrated system.

PCS (Permit Compliance System) is a computerized management information system that contains data on National Pollutant Discharge Elimination System (NPDES) permit holding facilities. PCS tracks the permit, compliance, and enforcement status of NPDES facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and its Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

NCDB (National Compliance Data Base) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Toxic Substances Control Act (TSCA). The system tracks inspections in regions and states with cooperative agreements, enforcement actions, and settlements.

The NEI (National Emissions Inventory) database contains information on stationary and mobile sources that emit criteria air pollutants and their precursors, as well as hazardous air pollutants (HAPs).

NJ-NJEMS (New Jersey - New Jersey Environmental Management System). The Department of Environmental Protection (NJDEP) manages large

ATLAS REFINERY INC (Continued) **1000157678**

databases of environmental information in this integrated system.

PCS (Permit Compliance System) is a computerized management information system that contains data on National Pollutant Discharge Elimination System (NPDES) permit holding facilities. PCS tracks the permit, compliance, and enforcement status of NPDES facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

Other Pertinent Environmental Activity Identified at Site

NJ-NJEMS (New Jersey - New Jersey Environmental Management System). The Department of Environmental Protection (NJDEP) manages large databases of environmental information in this integrated system.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

DURALAC CHEMICAL CORP. (Continued) **1000148576**

TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

Other Pertinent Environmental Activity Identified at Site

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and its Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

SCA CHEM SERVICES CO /EARTHLINE DIV (Continued) **1000106493**

NCDB (National Compliance Data Base) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Toxic Substances Control Act (TSCA). The system tracks inspections in regions and states with cooperative agreements, enforcement actions, and settlements.

NJ-NJEMS (New Jersey - New Jersey Environmental Management System). The Department of Environmental Protection (NJDEP) manages large databases of environmental information in this integrated system.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for

BENJAMIN MOORE CO (Continued) **1000265348**

information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and its Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

NCDB (National Compliance Data Base) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Toxic Substances Control Act (TSCA). The system tracks inspections in regions and states with cooperative agreements, enforcement actions, and settlements.

The NEI (National Emissions Inventory) database contains information on stationary and mobile sources that emit criteria air pollutants and their precursors, as well as hazardous air pollutants (HAPs).

NJ-NJEMS (New Jersey - New Jersey Environmental Management System). The Department of Environmental Protection (NJDEP) manages large databases of environmental information in this integrated system.

PCS (Permit Compliance System) is a computerized management information system that contains data on National Pollutant Discharge Elimination System (NPDES) permit holding facilities. PCS tracks the permit, compliance, and enforcement status of NPDES facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

FINDS:
Other Pertinent Environmental Activity Identified at Site

The NEI (National Emissions Inventory) database contains information on stationary and mobile sources that emit criteria air pollutants and their precursors, as well as hazardous air pollutants (HAPs).

NJ-NJEMS (New Jersey - New Jersey Environmental Management System). The Department of Environmental Protection (NJDEP) manages large databases of environmental information in this integrated system.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

NJ-NJEMS (New Jersey - New Jersey Environmental Management System). The Department of Environmental Protection (NJDEP) manages large databases of environmental information in this integrated system.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

NJ-NJEMS (New Jersey - New Jersey Environmental Management System). The Department of Environmental Protection (NJDEP) manages large databases of environmental information in this integrated system.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

Other Pertinent Environmental Activity Identified at Site

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and its Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

NCDB (National Compliance Data Base) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Toxic Substances Control Act (TSCA). The system tracks inspections in regions and states with cooperative agreements, enforcement actions, and settlements.

NJ-NJEMS (New Jersey - New Jersey Environmental Management System). The Department of Environmental Protection (NJDEP) manages large databases of environmental information in this integrated system.

RCRAInfo is a national information system that supports the Resource

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

NJ-NJEMS (New Jersey - New Jersey Environmental Management System). The Department of Environmental Protection (NJDEP) manages large databases of environmental information in this integrated system.

PCS (Permit Compliance System) is a computerized management information system that contains data on National Pollutant Discharge Elimination System (NPDES) permit holding facilities. PCS tracks the permit, compliance, and enforcement status of NPDES facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Other Pertinent Environmental Activity Identified at Site

CERCLIS (Comprehensive Environmental Response, Compensation, and Liability Information System) is the Superfund database that is used to support management in all phases of the Superfund program. The system contains information on all aspects of hazardous waste sites, including an inventory of sites, planned and actual site activities, and financial information.

NJ-NJEMS (New Jersey - New Jersey Environmental Management System). The Department of Environmental Protection (NJDEP) manages large databases of environmental information in this integrated system.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

FEDERAL RECORDS

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Date of Government Version: 01/25/2007
Date Data Arrived at EDR: 01/31/2007
Date Made Active in Reports: 03/12/2007
Number of Days to Update: 40

Telephone: 415-947-4246

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 09/27/2006
Date Data Arrived at EDR: 11/01/2006
Date Made Active in Reports: 11/22/2006
Number of Days to Update: 21

Telephone: N/A
Last EDR Contact: 02/23/2007
Next Scheduled EDR Contact: 04/30/2007
Data Release Frequency: Quarterly

DELISTED NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Date of Government Version: 12/28/2006

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

NPL RECOVERY: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Date of Government Version: 10/15/1991
Date Data Arrived at EDR: 02/02/1994
Date Made Active in Reports: 03/30/1994
Number of Days to Update: 56

Next Scheduled EDR Contact: 05/21/2007
Data Release Frequency: No Update Planned

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System

CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

Date of Government Version: 11/28/2006
Date Data Arrived at EDR: 12/19/2006
Date Made Active in Reports: 01/29/2007
Number of Days to Update: 41

Source: EPA
Telephone: 703-603-8960
Last EDR Contact: 03/21/2007
Next Scheduled EDR Contact: 06/18/2007
Data Release Frequency: Quarterly

CERCLIS-NFRAP: CERCLIS No Further Remedial Action Planned

Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

Date of Government Version: 12/20/2006
Date Data Arrived at EDR: 01/29/2007

Data Release Frequency: Quarterly

RCRA: Resource Conservation and Recovery Act Information

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. RCRAInfo replaces the data recording and reporting abilities of the Resource Conservation and Recovery Information System (RCRIS). The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month. Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month. Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month. Transporters are individuals or entities that move hazardous waste from the generator off-site to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Date of Government Version: 06/13/2006

US BROWNFIELDS: A Listing of Brownfields Sites

Included in the listing are brownfields properties addresses by Cooperative Agreement Recipients and brownfields properties addressed by Targeted Brownfields Assessments. Targeted Brownfields Assessments-EPA's Targeted Brownfields Assessments (TBA) program is designed to help states, tribes, and municipalities--especially those without EPA Brownfields Assessment Demonstration Pilots--minimize the uncertainties of contamination often associated with brownfields. Under the TBA program, EPA provides funding and/or technical assistance for environmental assessments at brownfields sites throughout the country. Targeted Brownfields Assessments supplement and work with other efforts under EPA's Brownfields Initiative to promote cleanup and redevelopment of brownfields. Cooperative Agreement Recipients-States, political subdivisions, territories, and Indian tribes become Brownfields Cleanup Revolving Loan Fund (BCRLF) cooperative agreement recipients when they enter into BCRLF cooperative agreements with the U.S. EPA. EPA selects BCRLF cooperative agreement recipients based on a proposal and application process. BCRLF cooperative agreement recipients must use EPA funds provided through BCRLF cooperative agreement for specified brownfields-related cleanup activities.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

STATE AND LOCAL RECORDS

SHWS: Known Contaminated Sites in New Jersey

The Known Contaminated Sites in New Jersey includes sites under the purview of the Site Remediation Program which have contamination present at levels greater than the applicable cleanup criteria for soil and/or groundwater standards. The sites appearing in Known Contaminated Sites in New Jersey are classified as either active, where the site is assigned to a specific remedial program area, or pending, where the site is awaiting assignment to a specific remedial program area. Sites where no further action (NFA) designation has been given are not included in this report unless there are other areas of identified contamination which have not been remediated. This report includes sites being remediated under all of the various regulatory programs administered by the Site Remediation Program such as: Federal Superfund Program, Federal Resource Conservation and Recovery Act (RCRA), New Jersey's Industrial Site Recovery Act (ISRA), New Jersey's Underground Storage of Hazardous Substances Act, New Jersey's Spill Compensation and Control Act, New Jersey's Solid Waste Management Act, New Jersey's Water Pollution Control Act.

EDR PROPRIETARY RECORDS

Manufactured Gas Plants: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:

CLIFFORD HEATH
Senior Vice President

March 19, 2008

Mr. John Wilkins
Project \Manager
NJ TRANSIT
One Penn Plaza East
Newark, NJ 07105-2246

Dear Mr. Wilkins:

The Alliance for Action is a uniquely diverse non-profit, non-partisan statewide coalition that brings together over 600 business, labor, professional, academic and government organizations. Our focus is to improve the quality of life in New Jersey through economic progress, job creation and responsible protection of our natural resources.

I'm writing this letter in support of the Portal Bridge Capacity Enhancement Program which is of vital importance to Newark and the region. The existing swing bridge is nearly a hundred years old and carries a capacity of twenty-three trains per hour in peak direction. As it currently exists, the bridge has to pivot open to allow marine traffic through, creating back up and delays on the Northeast Corridor, the most heavily used passenger rail line in the US. The capacity and design enhancements will both reduce the number of times the bridge needs to swing open and reduce the time of the open/close sequence.

In its current condition the Portal Bridge is a liability for the economic health of the region. Near capacity and near the end of its operational life expectancy, it requires costly ongoing maintenance with its mechanical and structural components prone to failure. The more often the swing bridge has to pivot for marine traffic, the more likely its malfunction and need for more maintenance. With the near-capacity traffic over this bridge, there are few windows of opportunity for maintenance and inspection.

The Portal Bridge Capacity Enhancement Program is a must do for the economic health of Newark and the region to function as a regional portal – not a liability

Sincerely,

Philip K. Beachem
President

John Wilkins
Portal Bridge Project
NJ TRANSIT
1 Penn Plaza, 8th Floor
Newark, NJ 07105

Dear Mr. Wilkins,

As a statewide association of general and speciality contractors involved in heavy and highway construction, site development and utility contracting on public and private projects. We are one of 96 state chapters all belonging to Associated General Contractors of America, the largest national construction association in the nation. We would like to affirm our strong support for the Portal Bridge Capacity Enhancement Program to enhance the capacity and improve the operation of the bridge.

First and foremost, this bridge project will create heavy construction jobs that are absolutely critical to the economic health and well-being of our region. Clearly we would advocate for this key job-creation aspect of the Portal Bridge project, but of equal importance in our position is the unquestionable need for this project from the perspective of regional transportation and therefore the regional economy. The capacity constraints, reliability concerns and operational inflexibility of the bridge impede the flow of the Northeast Rail Corridor and thereby threaten the regional economic growth that is driven by the Amtrak Northeast Corridor and the New Jersey Transit commuter rail system. It is that growth that underpins a thriving economy generating public and private construction jobs.

It is clear that the aging Portal Bridge is in desperate need of expansion and construction attention. The near-hundred year swing-bridge is near capacity and near the end of its operational life expectancy. In its current condition, the bridge impedes reliable and effective rail traffic on the Northeast Corridor. With its mechanical and structural components prone to failure, the Bridge requires costly ongoing maintenance. As it currently exists, the Portal Bridge has to pivot open to allow marine traffic through, creating back up and delays on the most heavily used passenger rail line in the US. The more often the swing-bridge has to pivot for marine traffic, the more likely it will malfunction and need more maintenance. But, with the near-capacity traffic over this bridge, there are few windows of opportunity for maintenance and inspection.

Raritan Center, Raritan Plaza II, Fieldcrest Ave., Edison, NJ 08837 • (732) 738-9454 • Fax: (732) 738-8722
email: Agcofnj@aol.com

SKILL RESPONSIBILITY INTEGRITY

As the Associated General Contractors of New Jersey has supported the Access to the Region's Core with its potential for creating significant numbers of heavy construction jobs building the Trans Hudson Express Tunnel, so we support the Portal Bridge Enhancement for that same fundamental bottom line reason. But, in addition, we see how important both these projects are to the mobility and therefore the health and economic well being of the region – today and over the foreseeable future.

Thank you for your consideration of our position.

Sincerely,

Brian N. Tobin

RE: Comments on Portal Bridge Capacity Enhancement Project Draft Environmental Impact Statement and 4(f) Evaluation

Dear Mr. Wilkins:

Please accept the following comments on the Portal Bridge Capacity Enhancement Project Draft Environmental Impact Statement "DEIS" and 4(f) Evaluation. Hudson County recognizes the statewide and regional benefits of the Access to the Region's Core "ARC" and Portal Bridge projects. The County of Hudson does not object to the projects, but respectfully requests that they be mitigated to minimize the impact to the local community and environment. The Hudson County Division of Planning is an A95 review agency for the County of Hudson. With regard to the Portal Bridge DEIS and 4(f) Evaluation, please accept the following comments:

1.0 COASTAL ZONE MANAGEMENT RULES

1.1 On December 17, 2007 the New Jersey Department of Environmental Protection "NJ DEP" revised the State's Coastal Zone Management Rules via N.J.A.C. 7:7E. The Rules apply to all coastal resources within or affecting the coastal zone, including: Coastal waters, which are any tidal waters of the State and all lands lying thereunder; All areas containing tidal wetlands; and the Hackensack Meadowlands District as defined by N.J.S.A 13:17-4. The DEIS appears to address sections 7:7e-3.2 through 7:7e-3.49. However, the DEIS does not satisfactorily address a significant portion of the revised rules, including:

1.2 **7:7E-3.40 Public open space** - (a) Public open space constitutes land areas owned or maintained by State, Federal, county and municipal agencies or private groups and used for or dedicated to conservation of natural resources, public recreation, visual or physical public access or, wildlife protection or management. (b) New or expanded public or private open space development is encouraged at locations compatible or supportive of

adjacent and surrounding land uses. (c) Development that adversely affects existing public open space is discouraged. (d) Development within existing public open space is conditionally acceptable, provided that the development is consistent with the character and purpose of public open space, as described by the park master plan when such a plan exists. (f) Provision of barrier free access to public open space is encouraged. (g) All new development adjacent to public open space will be required to provide an adequate buffer area and to comply with the Buffers and Compatibility of Uses rule (N.J.A.C. 7:7E-8.13). The buffer required will be dependent upon adjacent land uses and potential conflicts between users of public open space and the proposed adjacent land use.

1.2A The Above referenced rule is applicable to the Port Bridge project. The Federal Railroad Administration and NJ Transit should take all necessary precautions to minimize the taking and disturbance of parks, open space and conservation areas within the Project Area, including, but not limited to Laurel Hill Park, and facilitate public access to the Hackensack River waterfront.

1.3 **7:7E-3.43 Special urban areas** - (a) Special urban areas are those municipalities defined in urban aid legislation (N.J.S.A. 52:27D-178) qualified to receive State aid to enable them to maintain and upgrade municipal services and offset local property taxes. Under N.J.S.A. 52:27D-178 et seq., the Department of Community Affairs (DCA) establishes a list of qualifying municipalities each fiscal year.

1.3A Hudson County is the smallest, most densely populated and least affluent county in the State of New Jersey. In fact, eight (8) of Hudson County's twelve (12) communities are Urban Aid municipalities, including Bayonne, Hoboken, Jersey City, Kearny, North Bergen, Union City, Weehawken and West New York. Approximately 92.8% of the County's residents live in an Urban Aid municipality. The New Jersey Development and Redevelopment Plan "State Plan" treats all 12 Hudson County municipalities as a single "Urban Complex." In addition, nearly the entire population of the County is within a 7 mile radius of the Portal Bridge project area. NJ Transit should take special consideration to treat Hudson County as an "Urban Complex" pursuant to "State Plan."

1.4 **7:7E-3.50 Lands and waters subject to public trust rights** - (a) Lands and waters subject to public trust rights are tidal waterways and their shores, including both lands now or formerly below the mean high water line, and shores above the mean high water line. Tidal waterways and their shores are subject to the Public Trust Doctrine and are held in trust by the State for the benefit of all the people, allowing the public to fully enjoy these lands and waters for a variety of public uses. (b) Development that adversely affects lands and waters subject to public trust rights is discouraged. (d) Public access to lands and waters subject to public trust rights shall be provided in accordance with the public trust rights rule, N.J.A.C. 7:7E-8.11.

1.4A The above referenced rule is applicable to the Portal Bridge project. The Federal Railroad Administration and NJ Transit should comply with the spirit and letter of the Public Trust doctrine and facilitate public access to the Hackensack River waterfront.

1.5 **7:7E-7.5 Transportation Use rule** - (a) Standards relevant to roads are as follows: 1. New road construction must be consistent with the rule on location of linear development at N.J.A.C. 7:7E-6.1, and shall be limited to situations where: I. A clear need exists, taking into account the alternatives of upgrading existing roads and of using public transportation to meet the need; ii. Provision is made to include construction of bicycle and foot paths, except where these would not be feasible; iii. Provision is made to include, where appropriate, catwalks and parking access to nearby water bodies. iv. Provision is made for coordinated construction of public transportation rights-of-way and facilities, such as bus lanes, rail lines, and related transit stop or station facilities and parking, except where such construction would not be feasible; v. Visual and physical access to the coastal waters is maintained, to the maximum extent practicable; and vi. Induced development in conflict with coastal rules would not be expected to result. (b) Standards relevant to public transportation are as follows: 1. New and improved public transportation facilities, including bus, rail, air, boat travel, people mover systems and related parking facilities, are encouraged. 2. Development of existing rights-of-way which would preclude either their use for public transportation or public recreation trails is discouraged. © Standards relevant to bicycle and foot paths are as follows: 1. The construction of internal bicycle paths, foot paths and sidewalks in residential, commercial, and industrial developments is required to the maximum extent practicable. 2. Linear bicycle and foot paths are encouraged along the edges of all water bodies, and from the water body to the nearest public road, provided they would not disturb Special Areas, excluding flood hazard areas (N.J.A.C. 7:7E-3.25) and riparian zones (N.J.A.C. 7:7E-3.26, or subject to the user to danger. 3. Existing bicycle and foot paths shall be continued around development when it is not practical to pass through development.

1.5A The above referenced rule is applicable to the Portal Bridge project. The Federal Railroad Administration and NJ Transit should facilitate public access to the Hackensack River waterfront and mitigate any public access restraints through the construction of waterfront trails, bicycle lanes and footpaths.

1.6 **7:7E-6.1 Rule on location of linear development** - (a) A linear development as defined at N.J.A.C. 7:7E-1.8, shall comply with the specific location rules to determine the most acceptable route, to the maximum extent practicable. If part of the proposed alignment of a linear development is found to be unacceptable under the specific location rules, that alignment (perhaps not the least possible distance) may nonetheless be acceptable, provided the following conditions are met: 1. There is no prudent or feasible alternative alignment which would have less impact on sensitive areas and marine fish or fisheries as defined at N.J.A.C. 7:7E-8.2; 2. There will be no permanent or long-term loss of unique or irreplaceable areas; 3. Appropriate measures will be used to mitigate adverse environmental impacts to the maximum extent feasible, such as restoration of disturbed vegetation, habitats, and land and water features; and 4. The alignment is located on or in existing transportation corridors and alignments, to the maximum extent practicable.

1.7 **7:7E-6.2 Basic location rule** - (a) A location may be acceptable for development under N.J.A.C. 7:7E-3, 4, 5, 5A, 5B, and 6, but the Department may reject or conditionally approve the proposed development of the location as reasonably necessary to: 1. Promote the public health, safety, and welfare; 2. Protect public and private property, wildlife and

marine fisheries; and 3. Preserve, protect and enhance the natural environment.

1.8 **7:7E-8.11 Public trust rights** - (a) Public trust rights to tidal waterways and their shores (public trust rights) established by the Public Trust Doctrine include public access which is the ability of the public to pass physically and visually to, from and along lands and waters subject to public trust rights as defined at N.J.A.C. 7:7E-3.50, and to use these lands and waters for activities such as swimming, sunbathing, fishing, surfing, sport diving, bird watching, walking and boating. Public trust rights also include the right to perpendicular and linear access. Public accessways and public access areas provide a means for the public to pass along and use lands and waters subject to public trust rights.

"Public accessway" means a route that provides a means for the public to reach, pass along, and/or use lands and waters subject to public trust rights. Public accessways include streets, paths, trails, walkways, easements, paper streets, dune walkovers/walkways, piers and other rights-of-way.

Public accessways and public access areas shall: 1. Include perpendicular access and a linear area along the tidal waterway and its entire shore; and 2. If located in a natural area of a tidal waterway, be designed to minimize the impacts to the natural area and tidal waterway including impacts to habitat value, vegetation and water quality. (e) Except as provided in (f) below, in addition to the requirements of (d) above, the perpendicular access and linear area provided for sites located along the Arthur Kill, Kill Van Kull west of Bayonne Bridge, Newark Bay, Delaware River from the Trenton Makes Bridge to the CAFRA boundary, Elizabeth River, Hackensack River, Passaic River, Rahway River, Raritan River, Cohansey River in Bridgeton City, and Maurice River in Millville City, shall comply with the following.

Where development of a new or at an existing energy facility, industrial use, port use, airport, railroad, or military facility is proposed and the Department determines that perpendicular access and/or a linear area along the entire shore of the tidal waterway is not practicable based on the risk of injury from existing or proposed hazardous operations, or substantial existing and permanent obstructions, and no measures can be taken to avert these risks: i. The linear public access that would be required in accordance with (d) on site shall be reconfigured and enhanced to accommodate such structures and address such risks; or ii. If public access on site is not practicable in accordance with i above, alternate public access of comparable use to the public shall be provided at a nearby off site location.

1.8A The above referenced rule is applicable to the Portal Bridge project. The Federal Railroad Administration and NJ Transit should implement the Public Trust Rights and facilitate public access to, along and over the Hackensack River waterfront.

2.0 SECTION 4(F) EVALUATION AND GREEN ACRES RULES

2.1 All four alternatives of the Portal Bridge project (FE, FS, DE and DS) propose to take approximately 2 acres of Laurel Hill Park. In addition, the project proposes to take a portion of Riverbend Wetland preserve which is under the protection of the NJ Meadowlands Commission. The NJ DEP's Green Acre Program Rules permit disposals and diversions of parks and open space for bridge and transportation projects (pursuant NJAC to 7:36-25.2 et seq). However, the Department's policy strongly discourages it (pursuant to NJAC 7:36-26.1).

2.2 According to the New Jersey Statewide Comprehensive Outdoor Recreation Plan, or "SCORP," Hudson County is ranked 5th among counties in terms of population; it is ranked 19th among the 21 counties for total acres of State open space (Table 14, page 46). Hudson County is ranked 18th among the 21 counties, in total acres of county park space. Hudson County is ranked last, 21 out of 21 counties, in total acres of municipal park space. Hudson County is ranked last, 21 among 21 counties, in acres of Nonprofit Preserved Open Space. Finally, Hudson County is again ranked last, 21 among the 21 counties, for total acres of Preserved Open Space.

2.3 Hudson County is an urbanized region, with a largely disadvantaged population, and a profound dearth of open space and recreational opportunities for its residents. Using the 2000 U.S. Census figures, Hudson County is ranked last among counties in New Jersey, when calculating residents per acre of Preserved Open Space (199 people per acre) and last when calculating acres of open space per thousand residents (5 acres per 1,000 residents).

2.4 The SCORP's "Balanced Land Use Deficit" calculation (page 115) is supposed to take "into consideration the amount of additional open space needed in each municipality or county in order to satisfy the open space goals derived through balanced land use method.

2.5 The SCORP's Balanced Land Use Guidelines (page 55) recommend that 3% of the developed and developable area of a municipality should be preserved for recreation and open space. The guidelines also recommend that 7% of the developed and developable area of a county be preserved for parks and open space. Using the SCORP's Balanced Land Guidelines (page 55), neither Hudson County nor any of its municipalities meet or even come close to the standards established by the NJ DEP.

2.6 Attached is a Balanced Land Use table from Hudson County's Open Space Recreation Plan (pages 138-139). The Balanced Land Use Standard for municipal park space in Hudson County (based on 3%) is approximately 1,082 acres. However, municipal park space only accounts for 596 acres leaving a deficit of 485 acres, or 44.8%.

2.7 The Hudson County Open Space Recreation Plan also has a Balanced Land Use table for County park space (page 140). Using the BLU suggested standard of 7% of developable land, Hudson County should have approximately 2,563 acres of county park space. However, Hudson County has only 687 acres of park space. Therefore the county has a deficit of 1,875 acres or a deficit of 73%.

2.8 Due to the lack of parks and open space within Hudson County and the County's status as the least affluent county in New Jersey, the Federal Railroad Administration and NJ Transit should make every effort to mitigate the loss of parkland and open space in the project area within Hudson County.

3.0 HUDSON COUNTY PLANNING DOCUMENTS

3.1 In 1998, Hudson County and its 12 municipalities drafted a Strategic Revitalization Plan in response to the New Jersey Development and Redevelopment Plan. Most municipalities in New Jersey apply to be designated as "centers" by the State Planning Commission which confers certain funding and permitting benefits. Hudson County was the first county, and remains the only county in the State to prepare a regional plan which included all of its municipalities. The Strategic Plan set out a 20 year horizon for the future redevelopment and revitalization of the county. On January 27, 1999 the State Planning Commission endorsed the Hudson County Strategic Revitalization Plan making Hudson County and its 12 municipalities the State's only "urban complex."

3.2 Along with revitalizing the county's housing and commercial base, Hudson County officials envisioned new recreational and open space opportunities. The Strategic Revitalization Plan listed the creation of a "Hackensack River Urban Promenade" as an important action strategy (pages 44, 73).

3.3 In March 2002, the Hudson County Board of Chosen Freeholders approved the Hudson County Master Plan. The Master Plan is the key document guiding development within a given jurisdiction. The master plan was a document which took years to draft and was the result of dozens and dozens of meetings with elected officials, community organizations, businesses and private citizens from across the county and neighboring jurisdictions.

3.4 A prominent Land Use Goal of the Hudson County Master Plan listed on page I-1 is to "assist in the implementation of the development and redevelopment of the waterfronts of the Hudson, Passaic and Hackensack Rivers. An objective of the Master Plan for waterfront areas is to "encourage the construction of a coordinated waterfront walkway along the County's waterfronts" (Page I-1).

3.5 The Master Plan's Community Facilities objective #5 recommends Hudson County "Require developers to provide for coordinated public access in accordance with NJDEP's Hudson River Walkway and Hackensack River Walkway Plans" (Page I-4).

3.6 The Hudson County Master Plan's Community Facilities element states that "the Hackensack RiverWalk is a planned 8-mile waterfront park originally constructed as a small pedestrian path in conjunction with the Harmon Cove development in Secaucus. Completion of the trail will allow public access along the river while providing a continuous pedestrian trail linking Secaucus' retail, office commercial and residential districts. The trail links Lincoln Park in Jersey City to Hudson County Park and Boat Launch at Laurel Hill, Secaucus Transfer Station, Harmon Cove, Snipes Park, Trolley Park, Secaucus High School, Mill Ridge Road Ballfield, Harmon Meadows Plaza/Mill

Creek Mall and NJMC sponsored Mill Creek wetland trail" (Page VII-8).

3.7 The Community Facilities element addresses the creation of Greenways, stating: "A recent phenomenon in parks and open space is the creation of greenways. Greenways are a linear open space system linking existing parks and neighborhoods through trails, scenic roads, and bikeways. They buffer rivers, streams and wetlands that cleanse runoff waters and retain floodwaters. There are four different greenway that are proposed in Hudson County. The purpose of the greenways is to provide a continuous linear park system linking the various waterfront parks along the Hudson and Hackensack rivers, thus enabling walkers and bikers to get as close to the water's edge as possible" (page VII-10).

3.8 The Hudson County Master Plan's Conservation element recommends that the County "Provide financial and technical support for the Hudson River Waterfront Walkway and the Hackensack River Urban Promenade which will provide public access to the County's scenic vistas" (page X-12).

3.9 The Hudson County Master Plan states that the County contains 3,382 acres of parks and open space including 408 acres owned by municipalities, 716 acres owned by the County and 2,258 acres owned by the State. According to the New Jersey Open Space and Outdoor Recreation Plan standards, Hudson County had a county and municipal parkland deficit of 2,548 acres. The parkland deficit identified by New Jersey guidelines is offset by the fact that the State and Federal governments own over 2,258 acres of parks and open space in Hudson County. With the sole exception of Liberty State Park, however, the remaining State and Federal lands are largely wetlands which are inaccessible to the general public. Additional parks, open spaces and recreational opportunities are needed to make Hudson County a more attractive place to work and live.

3.10 As a direct outgrowth of recommendations of the Master Plan, County Executive Thomas A. DeGise began preparing to expand and rehabilitate Hudson County's park system. The County Executive's goal was ambitious... to double the amount of open space within the County.

3.11 In June 2003, the County prepared a "Hackensack Riverwalk Plan" which proposed creating a continuous waterfront trail linking Stephen R. Gregg Bayonne County Park to Lincoln Park in Jersey City, to Laurel Hill Park in Secaucus and further north.

3.12 The County drafted a "Green Map" using the Green Map System. The map identified existing parks and historic sites along with proposed recreational and open space opportunities including the Hackensack RiverWalk.

3.13 In September 2003, the "Green Map" along with a public opinion survey was mailed to over 30,000 households in Hudson County in anticipation of a referendum establishing an Open Space, Recreation and Historic Preservation Trust Fund. On November 4, 2003 the voters of Hudson County overwhelmingly approved the establishment of a Trust Fund dedicated to open space acquisition, park improvements and historic preservation projects.

3.14 In March 2005, the Hudson County Board of Chosen Freeholders approved the Hudson County Open Space and Recreation Plan as an element of the County Master Plan. Like the master plan before it, the Open Space & Recreation Plan reaffirmed the County's commitment to the Hackensack River Greenway. A prominent goal of the plan is "to ensure completion of the Hudson, Hackensack and Passaic Riverfront Walkways" (page 12) and "provide for scenic walkways and bikeways along the Hudson, Hackensack, and Passaic River waterfronts" (page 14). The Open Space & Recreation Plan mentions the Hackensack River Waterfront trail many more times.

3.15 The 2005 Hudson County Open Space & Recreation Plan lists the Hackensack River Swing Bridge as an eligible site for the State Register of Historic Places.

3.16 The Hudson County Open Space & Recreation Plan contains a strategic acquisition lists for sites to be acquired by or though the Trust Fund. The list contains the 59 acre site called "Little Snake Hill" which is an outcrop of rock and deciduous forest area located in close proximity to "Laurel Hill," also known as "Snake Hill" or "Fraternity Rock" (Page 170 and 171).

3.17 Since the adoption of the Hudson County Strategic Revitalization Plan, Hudson County Master Plan and Hudson County Open Space & Recreation Plan, County officials have been actively working toward establishment of the Hackensack River Greenway. County officials and staff have met with municipal representatives, environmental organizations, state agencies and public utilities. Hudson County has even discussed executing a conservation easement with Public Service Electric and Gas to facilitate public access to and through the "Little Snake Hill" site and utility road connecting Laurel Hill to the reconfigured Wittpenn Bridge and Charlotte Circle area.

3.18 In June 2007, the Hudson County Board of Chosen Freeholders officially adopted the Hudson County Park Master Plan Update for 2007-2013. The plan's goals include: "To assist in the implementation of the development and redevelopment of the waterfronts of the Hudson, Passaic and Hackensack Rivers." The objectives also state: "to encourage the construction of a coordinated waterfront walkway along the County's waterfronts; to ensure that new development provides public access to waterfront areas, recreational facilities, and open space, and use mechanisms to encourage plazas, public seating areas and amenities."

3.19 The 2007 County Park plan also lists parcels immediately south of Laurel Hill Park for acquisition and the future expansion of the park.

4.0 NEW JERSEY MEADOWLANDS MASTER PLAN

4.1 In October 2003, the New Jersey Meadowlands Commission adopted a Master Plan for the Meadowlands district. The NJMC Master Plan states that "Greenbelts and greenways can define and connect facilities (page 10-5). The Master Plan also "encourages the creation of waterfront esplanades" (page 10-18). The NJMC Master Plan contains a "Green Map" which delineates a proposed "Secaucus Trail" from Laurel Hill Park along the railroad/utility road south past the PSEG Hudson Generating Station to "Link to

Lincoln Park & Liberty Gap Trail" (Map 14). Finally, the New Jersey Meadowlands Commission has zoning authority over land within its district boundaries. The Land Use Plan (zoning map) contained in the NJMC Master Plan lists most of the parcels in Secaucus from the Croxton Yard to the Hackensack River as the "Penhorn Preserve"(Map 17).

5.0 EAST COAST GREENWAY PLAN

5.1 In December 2004, the New Jersey Department of Transportation prepared a "Northern New Jersey Route Location Study" for the "East Coast Greenway." The East Coast Greenway is a series of connected off-road trails linking the major cities along the eastern seaboard from Maine to Florida. The DOT commissioned a study prepared by the RBA Group, Inc. in conjunction with the NJ Committee East Coast Alliance. The study proposed the East Coast Greenway route through the State from Philadelphia to New York City. The study recommended the Boonton line swing Bridge over the Hackensack River as a locally preferred alternative off-road alternative (page 2-2 and map entitled: "Recommended Route Overview Map for Hudson and Bergen Counties").

6.0 CONCLUSION

The proposed Portal Bridge project will have an overall positive impact on the State of New Jersey and the region. However, the project area is within one of the most diverse, urbanized and densely populated counties in the country. In fact, Hudson County is the least affluent county in the State of New Jersey. The proposed Portal Bridge project does not directly benefit or serve Hudson County residents. Moreover, the project would take parks, open space, recreational opportunities and historic resources away from Hudson County's communities and residents.

The Federal Railroad Administration and NJ Transit should implement Executive Order 12898 to mitigate all Environmental Justice impacts to Minority Populations and Low-Income Populations. The FRA and NJT should implement New Jersey's Coastal Zone Rules (NJAC 7:7E-8.11) by providing public access to, over and around the Hackensack River Waterfront. The project should minimize and mitigate takings of parks and open space resources through aggressive replacement of parklands in the State's most urbanized county. Moreover, the Portal Bridge project should enhance and facilitate local projects and planning efforts including the NJ DOT's East Coast Greenway, Hudson County's Hackensack River Greenway and the New Jersey Meadowlands Commission's Secaucus Trail which all converge in the project area. Finally, pedestrian and bicycle access and circulation will enhance safety and security by creating a means of ingress for emergency vehicles to access the project area and a means of egress for both workers and passengers in case of an emergency.

If you need additional information or assistance, please feel free to call. Thank you for your attention to this matter.

Hudson County Division of Engineering Comments on the Draft EIS for the Portal Bridge Project

1. Wetland Mitigation: The Empire Track is identified as a possible Wetlands Mitigation site for the Portal Bridge. We would like to point out that Cedar Creek Marsh was to have been the Mitigation Project for the Kearny Connection Project and that this project was never carried out. We would also like to point out that in April 2007 a Northeaster resulted in unprecedented flooding that closed the Newark-Jersey City Turnpike, NJ Turnpike Interchange 15-W and the terminus of I-280 for eight days. An investigation by this office and the NJMC indicated that culverts constructed by NJ Transit as part of the Kearny Connection project were blocked and had not been maintained. We also believe that the original mitigation project would have reduced flooding problems that occur frequently on the Newark-Jersey City Turnpike under the Northeast Corridor Bridge. (See our comments below on the replacement Northeast Corridor Bridge over the Newark-Jersey City Turnpike). We would also like to point out that some Portal Bridge alternatives involve construction or permanent impacts to the Cedar Creek Marsh.

2. Laurel Hill Park: We would like to point out that the two acres in question are both parkland and wetlands. The mitigation for one, may not meet the mitigation standards for the other. In particular we would like to point out that the NJ Green Acres program and Statehouse Commission process require the replacement of parkland diverted to other uses, not the enhancement of existing parkland as appears to be suggested in the DEIS.

3. Maintenance & Protection Plan: Page 6-10 indicates that the NJDOT and Norfolk Southern must approve this, but Hudson County will have to approve this for work over the Newark-Jersey City Turnpike.

4. New Northeast Corridor Bridge over Newark-Jersey City Turnpike: As indicated at our meeting the Newark-Jersey City Turnpike was lowered to provide additional clearance under the Northeast Corridor Bridge. This has created a permanent low sport on our roadway which is subject to frequent flooding. We at a minimum, we believe the bridge should be constructed with a clearance of 14' 6".

Mr. John Wilkins, Project Manager
Portal Bridge Capacity Enhancement Project
New Jersey Transit
One Penn Plaza East, 8th Floor
Newark, NJ 07105

March 30, 2008

Dear Mr. Wilkins,

I am responding to the Portal Bridge Capacity Enhancement Project DEIS on behalf of the New Jersey Committee of the East Coast Greenway Alliance. As you are already aware, The Hudson County section of the planned New Jersey East Coast Greenway route traverses the project area.

Our long term off-road route plan utilizes the Hudson River Waterfront Walkway, the Harsimus Stem Embankment (aka, the 6th Street Embankment), and the Bergen Arches in Jersey City. Our Hackensack crossing will use the Wittpenn Bridge replacement. West of the Hackensack, the route will follow the shoreline at the Koppers Coke, Standard Chlorine and Diamond Shamrock sites, the Boonton Line pivot bridge service road and the Newark Industrial Line. East of the Hackensack there will be a spur north to Laurel Hill Park and the Lautenberg Transfer Station via Hudson County's planned Hackensack River Walkway which will use the Boonton Line service road. The Jersey City route may also include a parallel on-road route above the Bergen Arches. Figure 1 shows an overview of the proposed Hudson County route.

The main impacts to our route from this project will be west of the Hackensack. The loop portion of the ARC project is the main source of impact east of the Hackensack.

We do our routing in phases using temporary on-road routes, where needed, until the long-term off-road objectives can be achieved. Current projections for the Wittpenn Bridge replacement project are for construction to begin in spring 2010 and be completed by fall 2015. This range falls within the expected range for the Portal Bridge Capacity Enhancement Project. At present we do not have a time table for remediation of the Koppers Coke, Standard Chlorine and Diamond Shamrock brownfields sites.

Figure 2 focuses on the project area in more detail. The green line shows our long-term off-road objective. The brown line shows a detour around the brownfields sites until they are remediated. This bypass utilizes Belleville Turnpike and the Amtrak Portal Bridge service road. Should the Wittpenn Bridge project be completed significantly earlier than the Portal Bridge project, we will use Belleville Turnpike as an interim route.

Since this project will impact public park lands , including Laurel Hill Park in Hudson County, we are requesting that public access (bicycle and pedestrian) be provided along the Portal Bridge service road from Belleville Turnpike as part of the planned mitigation efforts.

When we first conceived the Hudson County route for the East Coast Greenway, we studied whether a Hackensack crossing at Laurel Hill Park was feasible. Once the Boonton Line pivot bridge was taken out of commission we determined that another crossing was necessary and we worked with DOT on using the Wittpenn Bridge replacement.

We endorse the request by Hudson County that the feasibility of adding bicycle/pedestrian access to one of the two planned replacements for the Portal Bridge be studied during the engineering phase of the project. It may be possible to combine bicycle/pedestrian access with service vehicle access. A crossing via one of the Portal Bridge replacements would connect Laurel Hill Park with natural areas west of the Hackensack. It would also serve as an additional crossing for the East Coast Greenway. Our experience is that bridges undergo maintenance work which sometimes results in bicycle/pedestrian access being temporarily suspended. Consequently, we would like to have more than one Hackensack crossing.

A copy of this letter was transmitted by e-mail on Sunday March 30 with hard-copy to be mailed on Monday March 31.

INSTITUTE FOR RATIONAL URBAN MOBILITY, INC.

George Haikalis
President

One Washington Square Village, Suite 5D
New York, NY 10012 212-475-3394
geo@irum.org www.irum.org

March 18, 2008

Statement at Portal Bridge DEIS Hearing

My name is George Haikalis and I am President of the Institute for Rational Urban Mobility, Inc. (IRUM), a NYC-based not-for-profit corporation concerned with improving public transport and reducing motor vehicle congestion in dense urban areas. I also chair the Regional Rail Working Group, a coalition of transit advocacy groups on both sides of the Hudson River.

IRUM opposes the four Portal Bridge alternatives described in the DEIS. The project sponsors failed to consider the options IRUM presented during the scoping process – (1) to permanently close the moveable bridge and (2) to consider routing the new Hudson River tunnel via Hoboken.

Given the extremely limited amount of marine traffic requiring vertical clearances greater than 23 feet at this location and because of the critical nature of this rail link for interstate commerce it is essential that public agencies seriously consider the benefits and costs of immediately closing this swing bridge. The risks associated with maintaining this bridge as a movable span are significant. The Portal Bridge should be welded closed immediately. The existing marine traffic can be accommodated in low profile vessels that can still traverse this reach.

Permanently closing the bridge also allows consideration of far less costly alternatives for expanding rail capacity across the Hackensack River. A second two-track bridge could be built immediately adjacent to the closed span, avoided the substantial loss of wetlands caused by building more widely-spaced spans considered in the DEIS.

Routing the new tunnel via Hoboken allows existing infrastructure to be better used. The four track tunnel under the Palisades and the three track lift bridge across the Hackensack River are already in place. Using these resources saves cost and completely eliminates the destruction of wetlands in the Meadowlands. Furthermore, the awkward and time consuming loops at Secaucus need not be constructed. Commuters from Bergen and Passaic Counties would save five to ten minutes using the more direct via Hoboken to Manhattan. By segmenting Portal Bridge and ARC into two separate projects, NJ Transit has avoided consideration of a Hoboken routing. Given the serious fiscal difficulties faced both by New Jersey and New York, it is essential that credible, cost-effective solutions be carefully considered.

IRUM recognizes the need to expand rail capacity across the Hudson River and urges that NJ Transit and FRA consider alternatives that would speed completion of this expansion by using existing infrastructure and avoiding environmental concerns that could delay this vital project.

Mr. John Wilkins, Project Manager
Portal Bridge Capacity Enhancement Project New Jersey Transit One Penn Plaza East, 8th Floor Newark, NJ 07105

March 31, 2008

Dear Mr. Wilkins,

This e-mail constitutes our brief response to the DEIS.

The existing bridge falls under section 106 of the National Historic Preservation Act and reuse of the structure looks unlikely at this point in time.

Consequently, we are requesting that the existing Portal bridge be documented to relevant historic archival standards before it is removed and/or dismantled.

Sincerely,

Mike Selender, Vice President
Jersey City Landmarks Conservancy

LACKAWANNA COALITION STATEMENT OBJECTING TO PORTAL BRIDGE CAPACITY ENHANCEMENT PROJECT AS CURRENTLY PROPOSED 3-31-08

I am David Peter Alan, Chair of the Lackawanna Coalition. We advocate for better rail service on the Morris & Essex and Montclair-Boonton Lines, on behalf of the riders, counties and municipalities along those lines.

The Coalition, along with the New Jersey Association of Railroad Passengers, the Empire State Passengers' Association and the Regional Rail Working Group, has objected to the "Access to the Region's Core (ARC)" plan as currently devised. Since the Portal Bridge Capacity Enhancement Project (Portal Bridge) and ARC are inextricably intertwined, we also state our objections to the Portal Bridge project as currently devised.

We particularly object to the segmentation of the Portal Bridge and ARC Projects, and we strongly request that both projects be remanded for consolidation as a single project. Any other result is misleading to the public and to decision-makers who must review the projects. In the public interest, we need transparency in the reporting of these projects and an honest evaluation of the cost of completing whichever enhancements between the City of Newark and the City of New York that New Jersey Transit wishes to make.

The Portal Bridge and ARC projects should have been considered as a single entity. More than that, the rail improvements contemplated for the entire region between the two stations in Newark (Penn Station and Broad Street Station) and Midtown New York should be considered as lying within the scope of a single project. This includes the ARC region into New York City, the Portal Bridge region from Swift Interlocking to the start of the ARC region, and the portion of the M&E and Northeast Corridor Lines from the two stations in Newark eastward to Swift. This third segment of railroad is not even considered in either of the projects, but there will be costs required for whatever upgrades of that segment are deemed necessary.

The segmentation of the projects in this manner is impermissibly misleading. The manner of presentation of the projects is confusing from a public review standpoint. In short, the public has a right to know what NJT wants to do and how much they want to spend to do it. One of the purposes of administrative review of decisions involving Federal funding is to ensure that the public is appropriately informed of the costs and benefits of a project. In the present case, this was clearly not done.

The projects at issue have been treated backwards, in terms of the need for the claimed enhancements, and in terms of chronology. Both the Federal Railroad Administration and the Federal Transit Administration have claimed that Portal Bridge is a precursor of ARC. However, a look at the actual utility involved demonstrates that this claim is patently false. Any additional capacity in the Portal Bridge region is necessitated by the capacity demands associated with the ARC project as currently devised. A no-build option for ARC does not require any additional capacity that would be associated with Portal Bridge. Even a baseline for ARC that would include the near-term improvements originally proposed for ARC and later withdrawn would not require any additional capacity that could be added through the Portal Bridge project. In short, there is no independent validity whatsoever for Portal Bridge without ARC.

The requirement that Portal Bridge must actually wait for the process to proceed on ARC, even though ARC is the "official" precursor to Portal Bridge, is misleading to the public and interferes with the orderly process of administrative review. Due to the intertwinement of the two projects, it would be inappropriate to merely reverse the order of consideration of the two projects. The only acceptable remedy is to consolidate the Portal Bridge and ARC projects for all future review. Moreover, any work to be done on the railroad between either of the stations in Newark and Swift Interlocking must also be included in the new combined project. Any other result would compromise the integrity of the project and the credibility of the review process.

The sole benefit for NJT of segmenting the Portal Bridge and ARC projects is the ability to confuse administrative reviewers and the public about the actual cost of the ARC project. Without ARC, Portal Bridge has no independent utility whatsoever, as a stand-alone project. ARC needs it, so it should be considered as part of ARC. However, separating the two allows NJT to claim that the $1.5 Billion cost of Portal Bridge is separate from the cost of ARC. This makes ARC look less expensive than it actually would be and is, in effect, cheating. ARC is also misleadingly made to look like a better performer than it would actually be, because the costs of Portal Bridge are not attributed to ARC. They should be, because additional capacity at Portal Bridge is unnecessary without ARC.

Hiding the cost of replacement of Portal Bridge generates an incorrect benefit/cost ratio for ARC that makes the project look better by a difference of 20%. Ascribing $1.5 Billion in costs required for ARC to the Portal Bridge project leads to the mistaken impression that ARC can deliver $9 Billion worth of performance for only $7.5 Billion in costs. Not only does this planning and accounting legerdemain mislead the public, but it also gives the false impression that the ARC project can outperform other projects competing for FTA funding. In effect, this is unfair competition for scarce FTA and FRA dollars.

The segmentation of the Portal Bridge and ARC Projects has also served to eliminate from consideration any other alternative project that might have proven more beneficial to the riding public, as well as the people of the New Jersey and New York region generally. A case in point is the proposal made by the Institute of Rational Urban Mobility and the Regional Rail Working Group to use five miles of existing rail infrastructure as part of a routing to Manhattan, through Hoboken. This proposal was discussed at several meetings of the Regional Citizens' Liaison Committee (RCLC) for the Portal Bridge Project. It is FTA policy that existing infrastructure should be used to the greatest extent possible. From a cost-effectiveness standpoint, such a policy makes sense. However, in the present case, we have been informed that the Hoboken alternative, which would save both mileage and money, was "outside the scope" of the project. This occurred only because the "scope" of the projects was set so narrowly that consideration of the entire affected area as a whole was precluded.

If the Portal Bridge and ARC Projects were not segmented as they were, the less-expensive and more efficient Hoboken alternative would have been available for consideration. This could have saved billions of dollars, an extremely important result in these times of fiscal difficulties for New Jersey and many other states. Certainly NJT had to undertake an operational evaluation of the proposed railroad(s) between the two stations in Newark and midtown Manhattan. There is no reason for segmenting the projects, except reasons that run contrary to the public interest. The project should be re-examined, with the entire length of the railroad from the two Newark stations to New York City as the area subject to proposal and review.

The proposed segmented projects makes a mockery of any policy aimed at presenting information transparently to the taxpaying public. The costs of the Newark to New York mega-project are allocated to two different projects (ARC and Portal Bridge), while only ARC receives any benefit. Without ARC, there would be no reason to expand capacity at Portal Bridge. The segmentation confuses the public and adds to the cost of the totality of the mega-project. In the interest of justice and fairness to the taxpaying public, the project should be re-evaluated as a single unit.

The FRA has already raised concerns about this issue, and the Environmental Protection Agency has called for an environmental review of the two projects, on a consolidated basis, for both analysis and impact mitigation purposes (copy of letter of April 10, 2007 submitted with this document). Environmental impacts, like costs, are cumulative and do not cancel each other out. Environmental justice also requires that the projects be consolidated as a single mega-project and the environmental impacts of this mega-project be appropriately disclosed to the public, the EPA and other concerned parties for review.

The ARC Project has also changed significantly from the former DEIS to the Supplemental DEIS now under consideration. The former project provided for interconnectivity between the existing line to Penn Station and the proposed new line. In the most recent downgrade of the project, these interconnectivity features have been eliminated. In essence, Amtrak will be precluded from using the proposed new line, so Amtrak derives no benefit from its construction. The level of service Amtrak now operates, and can be reasonably expected to operate in the foreseeable future, can be operated with the two currently-existing tracks. This decrease in utility of the entire Portal Bridge project further jeopardizes its cost-effectiveness.

There has never been a proper MIS for the Portal Bridge project. This is a serious flaw in the planning process. For instance, a properly-drafted study may have allowed for an effort to convince the Coast Guard that a slightly lower bridge could suffice for the purpose of this project. That would have saved a great deal of money, not to mention environmental considerations.

In short, the entire Portal Bridge process is flawed. It was not taken through every necessary step, and the initial segmentation of the Portal Bridge and ARC Projects was improper in the first place. These are not defects that can be cured prospectively. In the interest of justice, cost savings and transparency in reporting, it is necessary to consolidate the entire mega-project from Newark to Manhattan and begin the planning and evaluation process for the project as a whole. We of the riding and taxpaying public deserve no less.

MEADOWLANDS REGIONAL CHAMBER

Building Strong Businesses That Build Strong Communities

March 18, 2008

John Wilkins, Project Manager
NJ TRANSIT
One Penn Plaza East
Newark, New Jersey 07105

Dear Mr. Wilkins:

The Meadowlands Regional Chamber is a proactive business service organization in Northern New Jersey. We serve member businesses and local communities by taking leadership positions on critical issues facing the region. We work not only on behalf of member firms, but for the Meadowlands community at large and the municipalities that constitute the Meadowlands Region, including Carlstadt, East Rutherford, Hasbrouck Heights, Jersey City, Kearny, Little Ferry, Lyndhurst, Moonachie, North Arlington, North Bergen, Ridgefield, Rutherford, Secaucus, South Hackensack, Teterboro and Wood-Ridge.

We are committed to advising public agencies on a planning process that fosters economic development with enhanced mobility leading to a better quality of life.
An example of our commitment to projects and initiatives that will shape the region's transportation infrastructure for years to come was our most recent 2007 Transportation Summit, Meadowlands Mobility: An Economic Imperative. It is the context of this commitment that we express our support of the Portal Bridge Capacity Enhancement Program.

The Portal Bridge Capacity Enhancement Program is of utmost importance to the Meadowlands Region. The Bridge affects thousands of commuters, carrying 23 trains per hour in peak direction -- 393 NJT trains and 51 Amtrak trains every weekday. It is a critical link in Amtrak's Northeast Corridor and NJ Transit's commuter rail system that keeps the region's economy on track connecting Washington, Baltimore, Philadelphia and New Jersey with New York City. It is this transportation system that underlies and supports the quality of residential life and the vitality of business in Meadowlands communities.

In its current condition, the Portal Bridge unduly impedes reliable and effective rail traffic on the Northeast Corridor. With its mechanical and structural components prone to failure, the Bridge requires costly ongoing maintenance. As it currently exists, the Portal Bridge has to pivot open to allow marine traffic through, creating back up and delays on the most heavily used passenger rail line in the US. The more often the swing-bridge has to pivot for marine traffic, the more likely it will malfunction and need more maintenance. But, with the near-capacity traffic over this bridge, there are few windows of opportunity for maintenance and inspection.

Meadows Office Complex | 201 Route 17 N. Rutherford NJ 07070
Phone: (201) 939-0707 | Fax: (201) 939-0522 | www.meadowlands.org

In sum, the availability and reliability of rail transit is the backbone for business and commerce of the greater Meadowlands region which is why the Chamber has publicly supported the Access to the Region's Core. Our organization has advocated for many initiatives that appear to be out of the region itself because we are clearly conscience of the regional impacts projects such as this plays. But in order to realize the full economic potential of the Trans Hudson Express Tunnel, we must also correct the Portal Bridge bottleneck and add the extra bridge capacity in anticipation of the increased rail traffic of the two-track tunnel.

Therefore we offer our support for the Portal Bridge Capacity Enhancement Program.

Thank you.

Sincerely,

Jim Kirkos

RE: **Portal Bridge Capacity Enhancement Project**
Draft Environmental Impact Statement Comments

Dear Ms. Marcella:

The New Jersey Department of Environmental Protection (NJDEP) has completed its review of the Draft Environmental Impact Statement (DEIS) for the proposed Portal Bridge Capacity Enhancement Project. We offer the following comments for your consideration.

Green Acres

The NJDEP's Green Acres Program has determined that various Kearny, Hudson County and New Jersey Meadowlands Commission (NJMC) held properties are impacted by the proposed project. The DEIS provides, table 5.1-2, a list of potentially impacted properties. The following jurisdictional determination is based on the information found in the local unit's Recreation and Open Space Inventory (ROSI) on file with the Green Acres Program and additional information available.

Block 287 Lot 33 (Kearny) and Block 3 Lot 3 (Secaucus) – These properties are owned by the NJMC. They are not listed on the NJMC's ROSI and, therefore, are not encumbered by Green Acres.

Block 1 Lot 3 (Secaucus) – This property is owned by Hudson County and is encumbered by Green Acres.

Block 285 Lot 11 and 13 and Block 286 Lot 33 – These properties are listed on the municipal tax records as owned by the Town of Kearny. Tax data information suggest

that Lots 11 and 13 are held by Kearny for wetland purposes and therefore may be potentially held for conservation purposes. However, these properties are not listed on the Town's ROSI filed with Green Acres.

Any activities on Green Acres' encumbered parkland that are not in direct support of conservation or recreational uses will be considered a diversion and will require prior approval from the Commissioner of the Department of Environmental Protection and the State House Commission. See N.J.A.C 7:36-26. Please see the internet link below for access to the Program's rules via our website.

All lands held for conservation and/or recreation purposes at the time the local unit last received funding from Green Acres should be listed on the ROSI and come under the jurisdiction of the Green Acres Program whether the property is listed or not. Such lands are those owned, leased, or otherwise controlled by the local unit and may include land owned in fee, land leased from the Board of Education (or a private entity) for recreation purposes, land owned by a private entity upon which the local unit holds a conservation easement, or any land in which the local unit holds a specific recreation and/or conservation interest.

If there is question as to whether a property should / should not be included on the ROSI, please have the local unit consult N.J.A.C. 7:36-25.3 for guidance and contact the Green Acres Program directly if there are any questions. If there are any questions or you have additional properties that need research as to whether they are encumbered by Green Acres, please contact Robert Rodriguez of the Green Acres Program at 609-341-2056. The Green Acres rules can be found online at http://www.state.nj.us/dep/greenacres/regs.pdf. In order to request a diversion, the local unit, as the applicant should also contact Robert Rodriguez to discuss the requirements for State House Commission application.

Air Quality

This proposed project falls under the requirements of the Federal Transportation Conformity Rule (40 C.F.R> 93.100-160). This is because it is located in an area that exceeds, or used to exceed, the Federal health-based standards for ozone and fine particles. This rule requires that the Metropolitan Planning Organizations (MPO) demonstrate that the transportation projects (road and transit) in their Transportation Improvement Programs (TIPs) and Transportation Plans (TPs) are in conformity with the air quality emission budgets established in the State Implementation Plan (SIP). To demonstrate this conformity, the MPO conducts a regional emission analysis of projected on-road vehicle use that includes the increase in traffic volume from the addition of new projects. The MPO responsible for this project is the North Jersey Transportation Planning Authority (NJTPA).

This project is included in the NJTPA TIP For Year (FY) 2008-2012 under the reference number of T539. A discussion on transportation conformity should be included in the EIS.

Natural Resources

The NJDEP's Division of Fish and Wildlife's (DFW) concerns are directed to the specific impact areas noted below.

T&E Concerns

A search of the Landscape Project v2 with additional current data revealed the area is utilized by the northern harrier, glossy ibis, and snowy egrets. There is a peregrine falcon nest buffer to the south outside of the project area. A timing restriction of 3/15 to 8/15 would be necessary to protect these species during their breeding season. This timing restriction would also serve to protect other species that are protected under the Federal Migratory Bird Treaty Act.

Fisheries Concerns

As reported in the DEIS, this area of the Hackensack River supports anadromous fish. A water timing restriction of 3/1 to 6/30 is necessary to protect these species from any sediment generating activity and/or pile driving.

Site Remediation

The DEIS notes that the there are numerous areas of concern that are part of the proposed project site and adjacent to the project. The NJDEP's Site Remediation Program is actively reviewing reports involving sites that will be needed to construct and implement the project. New Jersey Transit should continue to work with the NJDEP on site remediation issue as the project advances to design, construction and operation.

Regulatory Requirements

The proposed project will need numerous permits and approvals from the NJDEP's Division of Land Use Regulation. New Jersey Transit should continue to work with the Division of Land Use Regulation as the project advances through design to construction.

Cultural Resources

The DEIS notes potential impacts to cultural resources. The NJDEP's Historic Preservation Office (HPO) has not completed its review of the DEIS. We will forward comments from the HPO to you once their review is completed.

Thank you for giving the NJDEP the opportunity to comment on the document.

Sincerely,

for KK

Re: Comments on the Portal Bridge Capacity Enhancement Project Draft Environmental Impact Statement

Dear Mr. Wilkins.

Please accept the following comments on behalf of New York/New Jersey Baykeeper ("Baykeeper"). Baykeeper is a conservation and advocacy organization with a mission to protect, preserve, and restore the Hudson-Raritan Estuary and its tributaries. Although Baykeeper understands and supports the continued efforts by New Jersey Transit to enhance transportation throughout New Jersey, and in and out of New York City, the Portal Bridge Capacity Enhancement Project ("PBCEP") must include public access and open space components to mitigate the impact to the surrounding community and environment.

Due to the expected affects to wetlands from the PBCEP, assessed at between 8.4 and 13.1 acres,[1] as well as other habitat destruction from acquisitions, such as the 2.0 acres of the 14.9-acres expansion area at Laurel Hill Park,[2] mitigation measures are necessary. Chapter 5.6 of the DEIS discusses how the proper restoration ratios will be applied for impacts to wetlands, developed with the proper agencies. In addition, page 5.1-16 of the DEIS, states that all property owners will be compensated for any land acquisitions resulting from this project. These two measures would, at a minimum, be necessary for this project to proceed forward. It is problematic that there is no discussion by PBCEP of plans to pursue other mitigation measures, such as preserving property surrounding the project to allow for public access and open space.

[1] *See* Table 5.6-5 of the DEIS.
[2] *See* 5.1-18 of the DEIS.

Page 5.1-16 of the DEIS discusses the necessity of PBCEP's land acquisition at the Laurel Hill Park expansion site, and Kearney Brackish Marsh/Cayuga Dike, for piers to support a bridge viaduct above the preserve. However, nothing in this chapter suggests the PBCEP would help complete other areas of the Hackensack River Walk (also referred to as the "Seacaucus Greenway" or the "Hackensack River Greenway") to make up for such acquisitions, as compensation alone is not enough. This project could be an opportunity for the PBCEP to improve upon the area, in both an environmentally and community driven way. We hope that PBCEP will coordinate with Hudson County and Baykeeper regarding the recently acquired 14.9 acres of land for wetland restoration around Laurel Hill Park, as well as regarding other public access and open space projects that could use PBCEP support, as a way to mitigate for environmental impacts from the expansion.

Sincerely,

Betsy McDonald

Subject: Comments on DEIS for Portal Bridge-Page1of3

Dear Mr. Wilkins, Mr. Valenstein,

We reviewed the "Draft Environmental Impact Statement for Portal Bridge Capacity Enhancement" dated February, 2008 summarizing considerations underlying the planning of this major transportation project and the conclusions about its feasibility and costs. We would like to commend the compilers of this report for the very comprehensive coverage of the various ecological and economic aspects leading to selection of the four acceptable alternatives best satisfying future transportation needs.

The estimated cost ranging from about $ 1.1 to $ 1.3 billion is formidable, with bridges and approach embankments in the environmentally sensitive wetlands accounting for about one-half of the total cost (DEIS Table 3-2). However, the cost of these basic project components would be materially reduced by lowering the rail profiles at the Hackensack River crossings and their approaches. We would like to suggest that this could be achieved, without diminishing the required vertical navigation clearances, by radical structural depth reduction of the bridges which can be obtained in a scheme with a steel deck. Attached sketch SK-1105-1 shows that structural depth of only about 5 ft would be possible, compared with 15 ft depth assumed in the DEIS Report (pg. 3-7).

In proposed design concept the steel plate deck acts as participating component of the bottom truss chords. The rails are mounted directly on the steel plate, with elastomeric pads under the rail base plates effectively dampening the noise. Railway bridges of this type have been successfully used in Europe, even in inhabited urban areas where noise was an important design consideration (see SK-1105-3). The steel deck plate also acts as the top flange of the floorbeams and the longitudinal girders, increasing their stiffness and resulting in rigidities equivalent to these of corresponding members in conventional ballasted deck construction.

Further important advantage will be in radical dead weigh reduction . For the track- carrying deck alone, the weight of about 9,000 lbs/ft of bridge in the ballasted deck scheme with a concrete deck will be reduced to abt. 2,800 lbs/ft for the steel deck scheme. This weight saving will, in turn, materially reduce the weight of the long-span trusses needed to support the deck and the railway loading, thus substantially decreasing the governing combined dead and live loading of the trusses, and their cost.

It should be noted that through-truss railway bridges with participating steel plate decks have also been designed with standard ballasted track beds. However, in such cases the structural depth reduction, compared

with the scheme shown in the DEIS, is smaller, and the dead weight saving is not significant. For the three-track Portal Bridge the structural depth of 5 ft (as shown in SK-1105-1) would be increased by about 2 ft, and the rail profile could be lowered only by 8 ft, instead of 10 ft if direct mounting of rails on the steel deck were used.

For the Northern Bridge the cost will be further significantly reduced by using a three-span continuous design (SK-1105-1), rather than three simple spans stipulated in the DEIS Report (Fig. S-3). As shown in SK-1105-2, continuous scheme results in substantially lower total D+ L moments, which may be further optimized, with the aim of reducing bending moments causing compression in the top chords of the trusses. With tension governing the top chord design, these could be made of higher-strength steel with lighter top chord members. Requirements for the upper lateral bracing will be correspondingly minimized, while the bottom truss chords, with large additional effective area contributed by the steel deck, will have ample capacity for axial compression, and will not need lateral bracing.

Further cost and maintenance savings will accrue from reduction of the number of bearings on the intermediate piers (see Elevation, SK-1105-2). Also, vulnerable and costly rail expansion joints, requiring careful inspection and maintenance, will be needed only at one end of the continuous bridge, while such expansion devices will have to be provided at three out of the four supports of the simple-span scheme.

Continuous trusses may be erected by launching, or by floating individual component spans and joining them subsequently for continuity, as may be most economical (see SK-1105-2). Erection by launching was used for the 2,100 long continuous railway bridge on tall piers over the Arkansas River, see attached article in *Civil Engineering.* (We were responsible for its superstructure and for launching design). In this case, with low bridge elevation over the Hackensack River, erection of pre-assembled spans by floating may be preferable. The method of optimizing bending moment distribution in continuous bridges by jacking supports is illustrated in our *"Design Manual for Orthotropic Steel Plate Deck Bridges"* (pp. 116-118,

attached).

We earned a reputation as top specialists in the field of design and construction supervision of steel plate deck bridges based on our record of continued work in this area of engineering since the 1960ties. After preparing the basic *Design Manual* for the AISC,
we were responsible for orthotropic deck provisions of the AASHTO Standard Specifications, and of the LRFD Spec's of 1994 and their 1999 revisions. Currently we are advising the AASHTO T-14 Committee on orthotropic deck design and fabrication provisions of future Specifications, to be based on current state-of-practice in the world. This subject is comprehensively presented in our 2007 (Heft 7) *Stahlbau* article which was invited by the Chairman of the Eurocode Committee for Steel Structures, Prof. G. Sedlacek. The article is contained in our Brochure.

In the field of practical design, we were responsible for the new steel orthotropic decks
on the Ben Franklin Bridge (Philadelphia, 1987), and the Champlain Bridge (Montreal, 1993).As sub-consultants to T.Y. Lin, Inc. we worked on retrofitting orthotropic decks on the Golden Gate Bridge and studies for an added lower orthotropic deck on this bridge (1991-2). In 2001-3 we acted as Prime Consultants to the Port Authority of NY and NJ for rehabilitation studies of orthotropic decks on the George Washington Bridge. Since 1999 we have been engaged by T.Y.Lin as independent reviewers of the self-anchored

suspension bridge of the San Francisco – Oakland Bay Crossing and, since 2004, as sub-consultants for design and construction phase engineering of this bridge. In 2004 we helped organize the ASCE *International Orthotropic Bridge Conference* in Sacramento, CA, and presented at this conference a two-day Seminar on design problems of orthotropic decks, with participation of key researchers in this field from the U.S., Canada, Europe and Japan.

Our work is reflected in numerous publications and design manuals (including the *Design Manual* referred to above and the *FHWA*

Specifications for the Design of Steel Box Girder Bridges, 1980), engineering handbook texts, over 40 technical papers in the American and European engineering journals. Reprints of some of our publications are contained in our Brochure, copy of which is being sent to you by mail.

We have been in contact with Howard/Stein-Hudson Associates Inc. handling the "Portal Bridge Capacity Enhancement Project" since January, 2007 and we sent to their address our initial suggestions on 1-16-07 . We also attended the Public Scoping Meeting in Newark on January 17, 2007. Based on information contained in the DEIS of February, 2008, we modified our original suggestions and developed them further, as summarized in our revised sketches SK-1105-1, 2, 3 dated March 17, 2008.

We suggest that an estimate of possible project cost reduction resulting from implementation of our recommendations be prepared, with assumptions and price projections consistent with these used in capital cost estimates for the various project components in Table 3-2 (p. 3-14) of the DEIS.

We would like to continue our cooperation with the Technical Advisory Committee, and to discuss our suggestions with its members, engineering consultants engaged in the preparation of the DEIS, and with the representatives of the agencies (FRA, TJ Transit Corp) in charge of implementation of the Portal Bridge Project. For your interest attached is our recent Letter to the Editor of *Civil Engineering* in which we emphasize importance of independent review of major bridge projects. Similar suggestions are contained in the *Public Works* editorial of February, 2008.

We would be glad to provide further input and to participate in the final design phase of this project in the areas of our competence and we would appreciate your suggestions regarding this possibility.

In the meanwhile, a public hearing intended to be held later this year would provide a good opportunity for discussion of the features and

engineering merits of the design schemes proposed above. We would be glad to prepare a brief informative presentation to be given at the hearing. Could such presentation, possibly among others, be included in the hearing program?

We look forward to your thoughts and suggestions in these matters.

With best wishes for success of the Portal Bridge project,

Sincerely yours,

ROMAN WOLCHUK

NOTES

1. In Proposed Alternative, successfully used in several European railway bridges, the steel deck plate acts as participating component of the bottom chords of the main trusses, as well as the top flange of the floorbeams and the longitudinal girders. Advantages of proposed alternative over conventional ballasted railway decks are:

   a) Dead weight saving on the track carrying deck. In this case the deck dead load alone of the proposed alternative will be about 2,800 lbs/ ft of bridge, compared with abt. 9,000 lbs/ ft for the ballasted deck design. Comparable weight and cost savings will also be achieved in the design of the main trusses.

   b) Radical reduction of the structural depth. With the steel deck design total depth from top of rail to the bottom of the floorbeam of 5 ft can be achieved, with structural rigidity of deck framing same as that of the ballasted deck structure estimated to be 15 ft deep (DEIS Report ,pg. 3-7). Consequently, the rail profile could be lowered by abt.10 ft This will permit less steep grades in the bridge approaches and will substantially shorten and reduce the width and the cost of approach embankments to be built in environmentally sensitive area.

   c) Structural and cost advantages of continuous trusses, compared with simple spans, are shown in SK-1105-2.

2. Participating steel deck concept can be also used to reduce the depth and cost of the lift bridge on southern alignment.

ELEVATION AND DETAILS

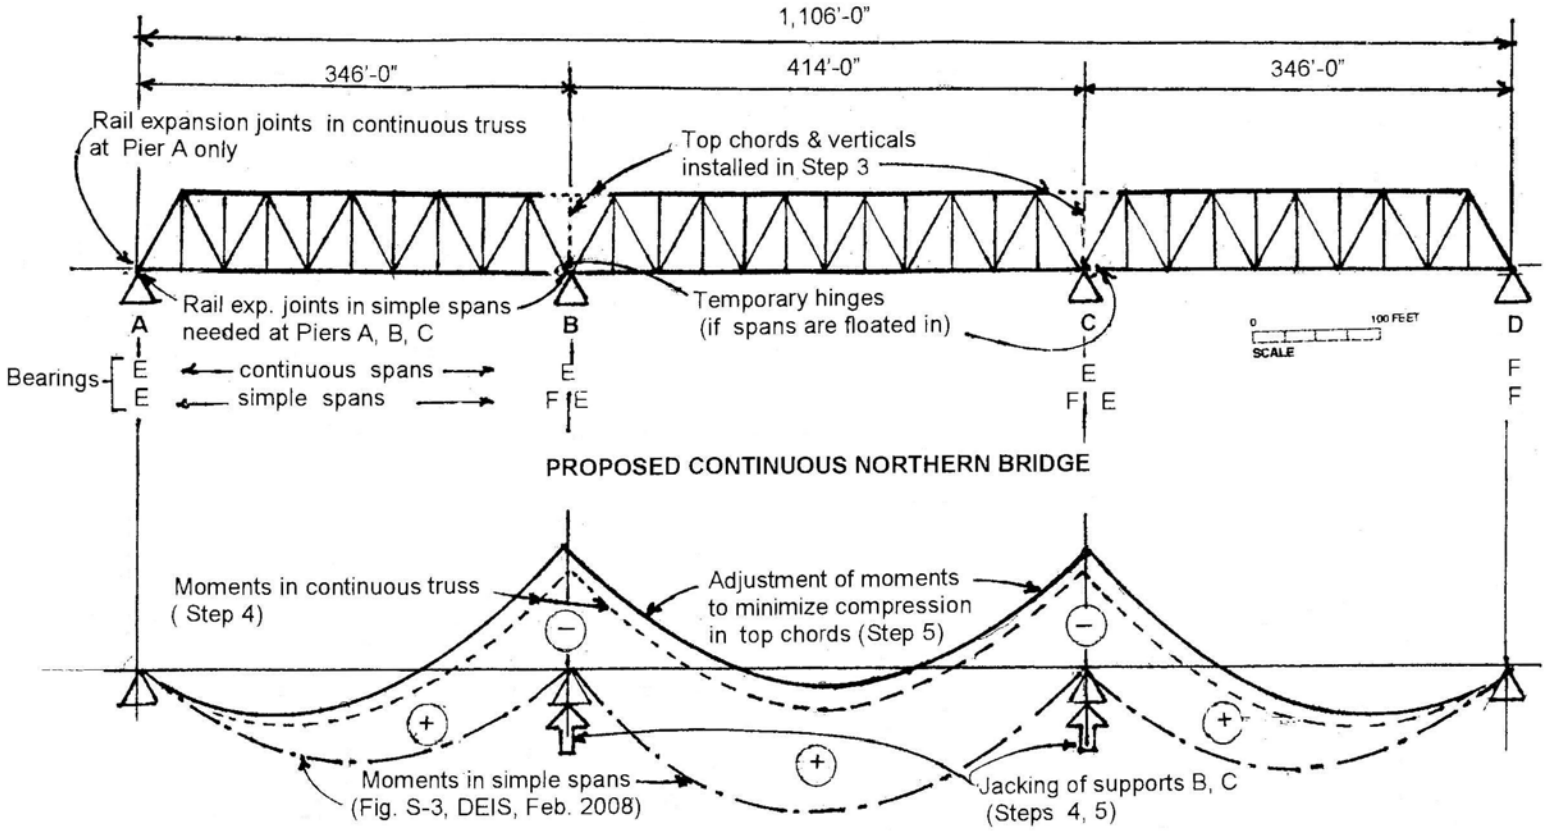
Revised March 17, 2008

Project: **PORTAL BRIDGE – PROPOSED DESIGN CONCEPT** Date: Jan. 19, 2007

ROMAN WOLCHUK
CONSULTING ENGINEERS

Scale: As shown

Drawing no.: SK-1105-1



DEAD LOAD MOMENTS

Advantages of truss continuity

1. Substantial reduction of maximal Dead Load moments, with possibility of further optimizing total D + L moments (see moment diagrams), with resulting steel weight savings;
2. Rail continuity over the 1,106 ft length of the bridge, with rail expansion joints at one location only, compared with need for such joints at three locations in a simple-span scheme. Rail expansion joints are complex and costly, requiring considerable maintenance effort over the service life of bridge.
3. Reduction of the number of bearings at the truss supports, from 12 for simple spans to 8 for a continuous bridge.

Possible erection procedures

In this case the contractor may have the following choices:

a) Launching the preassembled bridge halves from the abutments.(This was the method for erecting the KCS continuous railway bridge over the Arkansas River with a total length of 2,100 ft and a main span of 330 ft. which we designed , see attached *Civil Engineering* article). The advantage is keeping the navigation channel open during construction.

b) Floating the simple spans by barges and connecting them for continuity, with construction steps as follows:
   1. Float in and erect the main span;
   2. Float in the side spans and support them on Piers A, D, and the temporary hinges, as shown on sketch above;
   3. Install truss top chord members and verticals over the supports B and C to provide truss continuity;
   4. Jack up supports at B and C to obtain Dead Load moment distribution of a continuous truss;
   5. Optimize the maximum D.L. moments by further jacking aimed at minimizing the compression forces in the top chords under combined D.L. and L.L. moments. Note that bottom chords, reinforced with the participating steel deck, have ample capacity for compression, while the top chords of high-strength HP steel will act in tension, which will minimize the upper lateral bracing system.

LETTERS

Design Reviews Should Be Mandatory

My comments are prompted by two letters to the editor and a report—in Policy Briefing—on House Transportation and Infrastructure Committee hearings on bridge safety, all of which were published in the October issue.

William M. Hayden, Jr., Ph.D., P.E., F.ASCE, urges engineers in his letter "to tell the truth" about the deficiencies and precarious conditions of some bridges while recognizing that this may be perilous to individuals reporting such facts to the public. The letter by Paul Cella, P.E., F.ASCE, points out that engineers advocating intensified checking may be suspected of trying to increase the amount of work available to them.

Yet a system of mandatory independent checking of the design and construction procedures may be the only way to ensure the safety and longevity of our bridges. Such a system was introduced in the United Kingdom in the 1970s after four collapses of steel box girder bridges; that system was mentioned by Ian Firth, a partner of London-based Flint & Neill, in a paper he presented at the symposium "Improving Infrastructure Worldwide," which was held in Weimar, Germany, in September under the auspices of the International Association for Bridge and Structural Engineering. The causes of the failures were thoroughly investigated by [a committee], and on the basis of its findings new design and workmanship rules were prepared mandating rigorous independent review and checking.

A similar practice of independent checking exists in Germany, where structural designs for government agencies must be reviewed and approved by licensed review engineers. My coauthors and I advocated the comprehensive independent peer review and checking of major bridge rehabilitation or strengthening projects in an article ("The Use of Orthotropic Decks in Redecking of Bridges") that appeared in 2001 in the American Institute of Steel Construction's *Engineering Journal*. We stated that "the ultimate responsibility to the public . . . rests with the publicly or user-financed bridge owners who are legally obligated to maintain and preserve the bridges under care with the least expenditure of the taxpayer's money."

In actual practice, consultants working for bridge owners are under severe constraints imposed by competitive fees, with no budget allowance for independent checking. Therefore, as a rule, the designers are directed to do what we did before, which does not necessitate spending time on keeping up with progress in the field relating to bridge design, new structural systems, and innovations that may be more economical. From our experience, such suggestions are generally treated as unwarranted interference in the owners' projects. The bridge owners also tend to shun the risk of the unfamiliar, preferring routine solutions.

Similar practices obtain with the periodic inspections of bridges. The budgets here are generally insufficient, leading the owners to assign the work to the lowest-bidding consultants. This precludes the participation of high-salaried senior personnel and results in cursory inspections that are likely to overlook critical conditions.

Lack of independent, critical oversight of the design concepts results in unduly expensive structures that often replicate bridge designs of the past and often feature complex details that are costly and difficult to maintain. Examples abound:

- Suspension bridges have recently been built in seismic zones with traditional rigid support systems at the towers, whereas seismic decoupling is now the guiding design rule.
- On a recent project that involved the rehabilitation and widening of a major truss viaduct, the possibility of a substantial reduction of costs by reducing the dead weight was not utilized. The expensive design attracted only a single bid, exceeding by $70 million the original budget estimate, and even this was substantially increased as the project proceeded.
- The orthotropic redecking of several suspension bridges was designed with unnecessarily complex and expensive details, resulting in very high fabrication costs. On one of these projects the new decks cracked one year after the deck installation. In this case, a critical review of the analysis (which had predicted an 81-year fatigue life) and of testing results (which clearly indicated fatigue susceptibility) would have prevented the failure.
- The costly disaster in Boston on the so-called Big Dig tunnel could have been prevented by rigorous independent oversight of the construction methods and materials used.
- The causes of the Minnesota bridge collapse, which claimed the lives of 13 people, are still shrouded by confidentiality agreements. Sources suggest paving construction loads, underdesigned gusset plates, ongoing corrosion, and broken bearings. All of these potential causes could have been identified by a review of the design of the original bridge, as well as by timely, well-supervised inspection.
- The 2006 fatal collapse of the viaduct in Laval, Quebec, also was caused by inadequate quality control. According to the inquiry report just submitted to the Quebec government, the designer, the contractor, and the subcontractor of the concrete prestressed box girder all received blame for "poor workmanship, insufficient oversight, and poor maintenance" leading to the collapse. Following this disaster, the Quebec government is creating an independent agency that will be responsible for the province's bridges.

In the United States several forms of checking procedures are available; however, these are seldom effectively utilized in actual bridge design and construction practice. The desired safety and long-term economy of our bridges can be attained only if independent review and checking provisions are made mandatory. In addition to adding confidence and reducing risk, a culture of independent checking and rigorous quality controls would result in saving billions of dollars in the construction and maintenance costs of bridges. Another benefit would be in enhancing the professional knowledge of engineers through the critical evaluation of various design approaches, stimulating better understanding of structural behavior.

ASCE's participation and input in recent congressional hearings on bridge safety should be commended. However, I suggest that ASCE address jointly with other professional organizations and governmental agencies the root causes of our infrastructure problems and take the lead in formulating the rules for mandatory independent review and checking of the design and construction of all major bridge projects.

Roman Wolchuk, P.E., F.ASCE
Jersey City, New Jersey

To err is human

What to make of the news that the Aug. 1 collapse of the bridge carrying I-35 over the Mississippi River in Minneapolis was due to human error? And that all the inspection processes in the world wouldn't have prevented it?

Last month the National Transportation Safety Board (NTSB) attributed the failure to a design flaw: two little words that belie the gravity of the consequences. Some of the steel gusset plates that supported the bridge's two main trusses were roughly half as thick as required by 1960s design standards. The plates that were undersized on the bridge are undersized on the drawings, and the board can't find the original calculations. Therefore, it can't say whether the error was a miscalculation or a drafting mistake.

It's not unusual for owners of huge projects, such as the multibillion-dollar seismic upgrade of the San Francisco-Oakland Bay Bridge, to have designs independently reviewed. But the United States doesn't require this step.

Nor could anyone have been expected to discover the mistake. The Federal Highway Administration's (FHWA) National Bridge Inspection Standards don't address design errors. Each time the bridge was modified, including when the concrete deck was increased from 6.5 inches to 8.5 inches, Minnesota DOT engineers recalculated stress levels for what they thought were the bridge's weakest members—which did not include the gussets.

Does this mean every structural element should be re-evaluated every time a major modification is made? If so, is that a wise investment of tax revenues?

England's Highways Agency thinks so. Since the 1970s, after four steel-box girder bridges collapsed, the agency has required that designs for both new construction and major upgrades be reviewed and approved by independent design engineers. The check is conducted during the design process, not once the design is completed. Sometimes the review includes an economic analysis of the proposed design, which sometimes leads to a more cost-effective—though equally viable—design.

Web extra:
To read The Highways Agency's language requiring design reviews, visit the "article links" page under "resources" at www.pwmag.com.

Estimates for how much this step adds to overall project costs range from 30% of the design fee to less than 0.5% of construction.

The NTSB recommended that FHWA require owners of "non-load-path-redundant" steel truss bridges to conduct load capacity calculations to verify that the stress levels in all structural elements, including gusset plates, remain within applicable requirements whenever planned modifications or operational changes may significantly increase stresses." In addition, Washington could make independent reviews mandatory for public works departments.

Much like a water manager justifying the expense of a new treatment process or plant to meet EPA standards, road and bridge managers would have an "excuse" for the extra cost involved.

And if FHWA declines to do so? How much is a human life worth to your community's residents? Your job is to make them aware of the options for maintaining their quality of life. It's up to them to decide.

Subject: Response to Comments
Draft Environmental Impact Statement, Portal Bridge, February 2008

Dear Mr. Wilkins:

The following comments to the "Draft Environmental Impact Statement, Portal Bridge Capacity Enhancement and Draft Section 4(f) Evaluation" dated February 2008 are submitted by Tierra Solutions, Inc. for consideration based on review of the documents available at the NJ Transit website http://www.portalbridgenec.com/library.html.

If you have any questions regarding this submission, please contact the undersigned at (732) 246-5848.

Sincerely,

Enrique Castro
Project Manager
Tierra Solutions, Inc.
on behalf of Occidental Chemical Corporation
(as successor to Diamond Shamrock Chemicals Company)

COMMENTS/CONCERNS
DRAFT ENVIRONMENTAL IMPACT STATEMENT, PORTAL BRIDGE CAPACITY ENHANCEMENT AND DRAFT SECTION 4(F) EVALUATION
FEBRUARY 2008

The following comments are provided by Tierra Solutions, Inc. to help clarify specific aspects of the Draft Environmental Impact Statement, Portal Bridge Capacity Enhancement and Draft Section 4(f) Evaluation based on review of documents posted at the NJ Transit website http://www.portalbridgenec.com/library.html.

Item 1

Executive Summary (February 2008)

K. Contaminated Materials (p. S-17)

Comment 1

Construction of the portal bridge project, regardless of the alternative selected, will involve disturbance to the western shoreline of the Hackensack River and the northern and southern flanks of the existing Amtrak railroad Northeast Corridor over a distance of approximately 15,000' (3 mi.) from Swift Interlocking to Secaucus Station (Figure 2). This includes a roughly 4,000' wide (north to south) segment [2,000' on both sides of Northeast Corridor] from the west bank of the River to a few hundred feet west of Belleville Turnpike (State Route 7). On both sides (north and south) of this Northeast Corridor segment are properties that are designated New Jersey Department of Environmental Protection (NJDEP) Hudson County Chromate Chemical Production Waste Sites. The specific properties of concern are addressed in comments under Chapter 05-07 Contaminated Materials.

Item 2

Contaminated Materials (p. 15, 2nd paragraph)

"The Phase I assessment described in this section identifies a four-tiered investigation: (1) past and current land use review, including a review of historic aerial photographs and Sanborn maps; (2) contaminated database and record research; (3) review of previous site investigation; and (4) site inspection. It also calls for photographs taken during site inspections and review of relevant regulatory (NJDEP and USEPA) files."

Comment 2

Each of these four elements is generically appropriate for a Phase I assessment. However, relevant up–to-date information on the status of each site or property should be identified in the area likely to be disturbed by the proposed project. As discussed below, information in the referenced

documents is only as relevant and accurate as the source data from which it originated and the frequency upon which the database is updated. Numerous discrepancies have been identified previously in such databases, including obsolete information, omission of sites, incorrect address listings or locations on maps provided, and/or erroneous or obsolete descriptions of site status. It is suggested that properties identified within the designated 4,000' distance spanning both sides of the Northeast Corridor and Portal Bridge proposed project area be given a higher level of scrutiny than properties outside this area through direct contacts with property owners, local officials, and/or occupants of the specific property, particularly where a building is occupied and utilized on the site.

Item 3

05-7 Contaminated Materials (Chapter 5.7)

Methodology

"The primary study area for the contaminated materials assessment includes those areas where construction activities would occur as part of one or more of the build alternatives. The secondary study area for this analysis is the area roughly between Swift Interlocking to the west and Secaucus Transfer Station to the east, 2,000 feet north and 2,000 feet south of the Northeast Corridor."

Comment 3

Construction of the portal bridge project, regardless of the alternative selected, will involve disturbance to both shorelines of the Hackensack River and the northern and southern flanks of the existing Amtrak railroad [Northeast Corridor] over a distance of approximately 15,000' (3 mi.) from Secaucus Station to Swift Interlocking (Figure S-1 and S-4). This includes a 4,000' wide segment (north to south) from the west bank of the River to a few hundred feet west of Belleville Turnpike (State Route 7). On both sides of this Northeast Corridor segment are properties that are or were designated New Jersey Department of Environmental Protection (NJDEP) Hudson County Chromate Chemical Production Waste Sites. Several of these sites will be affected by any one of the build alternatives described in this DEIS. These properties are shown on attached Figure A.

There are four properties that directly border the Northeast Corridor segment, including: NJDEP Site 103 (Amtrak Access Rd), Site 113 (Diamond Shamrock), Site 58 (Nicole's Warehouse), and Site 131 (Hackensack River Access Rd). The last of these three is a man-made dike (approximately 3,000' in length) typically 20-30' wide that serves as the west bank of the Hackensack River and separates the River from tens of acres of wetlands extending west to Belleville Turnpike and northward beyond the I-95/New Jersey Turnpike Eastern Spur bridge over the Hackensack River. Site 103 (Amtrak Access Rd.) is located immediately adjacent to the Northeast Corridor on its northern flank. Site 58 (Nicole's Warehouse) is located adjacent to and south of the Northeast Corridor and west of Belleville Turnpike. Two other properties, Sites 50 (Janatex) and 51 (Kearny Township #1), abut Site 103 to the north and extend northward to the aforementioned wetlands. There are two additional NJDEP chromate properties near the southern flank of the Northeast Corridor on the west side of Belleville Turnpike: Site 47 (Goldies' Auto Parts) and Site 48 (Clinton Cartage), both are currently being utilized as commercial businesses but it does not appear these will be impacted any of the DEIS build alternatives.

Sites 47, 48, 50, 58 are occupied by ongoing commercial businesses. There are mobile trailers parked on or adjacent to Site 103, and a few aged buildings in use for equipment and materials storage remain at Site 113. There are no buildings on Sites 51, 103, and 131. Sites 50, 103, 113, and 131 will all be impacted by any of the build alternatives. Sites 51 and 58 may also be affected given their close proximity to the Northeast Corridor.

Each of these sites reportedly contains deposits of chromite ore processing residue (COPR). These sites have been characterized extensively through remedial investigation efforts overseen by NJDEP. Although the remedial investigation reports for many of the sites remain to be reviewed by NJDEP and site remedial actions remain to be developed and implemented, caps have been installed at each site and are being routinely monitored and maintained to preclude human exposure to the underlying COPR and its primary contaminant of concern, hexavalent chromium [Cr(VI)].

Within the context of the portal bridge project DEIS, it is important to recognize that the COPR sites are part of a separate effort to investigate, characterize, and assess remediation alternatives under a consent order between representatives of the Site 113 (Diamond)property owner and the NJDEP. These activities are ongoing.

Item 4

Preliminary Site Screening Methodology

"The contaminated materials assessment began with identifying all potential sites of concern within the secondary study area…A report summarizing the environmental database search was prepared by Environmental Data Resources, Inc. (EDR)" that "shows the federal and state databases that were searched…Some of the properties…have undergone extensive environmental investigations and, where feasible, public-available environmental studies were reviewed as part of this analysis."

Comment 4

Care needs to be exercised when reviewing and using information in the referenced relevant regulatory and archived files (i.e., databases). Recovery and review of information obtained from such databases for the aforementioned COPR sites has yielded, recently and in the past, many discrepancies, errors, and omissions. These include such concerns as (a) the absence of some sites from the applicable database, (b) incorrect or missing site location addresses and/or incorrect site demarcation on map(s), and (c) designation of sites that have been eliminated from earlier lists of NJDEP chromate sites (e.g., Site 182).

Item 5

Table 5.7-4 Secondary Screening-Sites Potentially Requiring Further Investigation

Comment 5

With respect to sites designated as Hudson County Chromate sites, the Site Identification for Item No. 13 should be Nicole's Warehouse Hudson County Chromate Site 58; the Site identification for

Item No. 15 should be Hudson County Chromate Site 48 Clinton Cartage; the Site identification for Item No. 16 should be Standard Chlorine Chemical Company, Inc., Hudson County Chromate Site 116; the Site Identification for Item No. 17 is the same site as Item No. 16; the Site identification for Item No. 18 should be Diamond Shamrock Corp., Hudson County Chromate Site 113; Item Nos. 19 and 20 are the same site as Item No. 18.

Item No. 19 in Table 5.7-4 names Sevenson Environmental for the 1015 Belleville Turnpike (Site 113). This is an obsolete entry in the database, as Sevenson has not occupied Site 113 as a contractor working for the Site owner for over eight years.

As indicated above, there are several Hudson County Chromate sites missing from Table 5.7-4, including: Sites 47, 51, 103, and 131.

Item No. 40 in the table is Hudson County Chromate Site 59 (Trumbull Asphalt, a.k.a. Owens Corning); however, it is located well outside the 2,000 ft band south of the Northeast Corridor.

Also, Item No. 46 designates Site 182 as a NJDEP Chrome site. Site 182, Radial Casting/Electric Company, was preliminarily listed by NJDEP in the 1990s based on questionable information. Following further investigation and records review, Site 182 was removed by NJDEP from the Hudson County chromate sites list sometime prior to 2000.

Item 6

Additional Information on Selected Proximate Sites (p. 14)

"The following sites, all in close proximity to the project site and potentially subject to direct disturbance (e.g., excavation) associated with one or more build alternatives, are discussed below in terms of history, known contamination, jurisdiction, remediation plans, etc."

Diamond Shamrock, Standard Chlorine, Koppers Coke, and Hackensack River Sediments (p. 15)

"Investigation and remediation of this property [Diamond Shamrock] has been and may to some extent continue to be tied to that of two properties to the south…known as 'Standard Chlorine' and "Koppers Coke.""

Comment 6

The Koppers Coke site, which abuts the southern boundary of the Standard Chorine site, is also known as the Seaboard Site in the administrative records of NJDEP.

An Interim Remedial Action Workplan (IRAW) has been prepared and submitted to NJDEP. The Workplan includes the installation of a barrier wall around the perimeter of the Diamond and Standard Chlorine Sites to allow for containment and extraction of groundwater from the two sites.

The barrier wall will connect with the existing barrier wall along the river of the Seaboard (a.k.a. Koppers Coke) Site. The Workplan has been the subject of several written communications between the responsible parties for the three properties and the NJDEP.

On p. 16, 1st paragraph, regarding the Koppers Coke site, the 2nd sentence indicates "portions of the site are still in active use." This may be misleading to the reader. The coke plant and coal tar processing facilities were razed many years ago. The only known "active use" of the site is a marine loading facility along the river in the eastern portion of the site. Later in the same paragraph, there is sentence indicating "proposed remedial action (not yet implemented, but expected to begin in the near future) include placement of a cover of processed dredged material (PDM), a subsurface barrier system along the Hackensack River, and recovery of NAPL." This information is not completely accurate A remedy was approved by NJDEP and was partially implemented several years ago, which included the installation and operation of a NAPL recovery system. Additional remedial work to complete the remedy has been recently approved by NJDEP.

Similarly, the next paragraph pertaining to "sediments in portions of the Hackensack River" is not accurate. The Hackensack River remedial investigation work plan (RIWP) referenced in this section has been implemented and the data has been submitted to NJDEP.

Item 7

Jana Corporation and Other Potential Chromium Sites

p. 16, lines 7-9. "...The project area west of the Hackensack Rive may be contaminated with chromate ore and there are thought to be at least 160 such sites in the vicinity of the Portal Bridge."

Comment 7

This paragraph is misleading from two perspectives. First, "chromate ore" is a misnomer in that chromite ore is the raw material that was used to manufacture chromium chemicals, principally chromate compounds. The chromite ore is not the material of interest at the Hudson County chromate sites, rather the fraction of chromate in chromite ore processing residue (COPR) is the material of interest at these sites. Second, there are nine (9) COPR sites in the vicinity of the Portal Bridge, including the (Sites 47, 48, 50, 51, 58, 103, 113, 116, and 131), not "at least 160 such sites" as stated on lines 7-9. As previously stated, Sites 50, 103, 113, and 131 will be affected by any of the proposed build alternatives. Sites 51 and 58 will potentially be affected.

The following clarification is provided: "Additionally, this site (NJDEP Site 50) is one of the Hudson County chromium-contaminated sites. Adjacent and east of the Jana Corporation property is NJDEP Site 51, which abuts to the east Site 131 (Hackensack River Access Rd.). Site 131 is a narrow strip of land (approx. 3,000 ft long) that forms the western perimeter of the Hackensack River and is located immediately north of the Portal Bridge. It abuts another chromium-bearing property, Site 103 (Amtrak Access Road), which is a strip of property immediately adjacent to the north flank of the Amtrak railroad embankment [Northern Corridor] that extends from the River to Belleville Turnpike. Site 103 forms the southern boundary of Sites 50, 51, and 131, as shown in Figure A.

Item 8

Scoping Document – December 2006

06 Construction Impacts
Land Use and Socioeconomic Conditions (p. 12)

Hudson County Chromate sites

"Accurate identification of existing land uses, other proposed projects, and a clear understanding and representation of current and proposed public policies in the study area will be essential information throughout the planning process."

"If an alternative would require the acquisition of public and/or private land, a description of the affected land (location area, existing use, ownership, etc.) will be provided. If the acquisition requires the displacement of existing businesses or individuals, characteristics and needs to these affect persons and businesses will be described and in inventory of replacement sites/dwellings will be provided. Any relocation issues will be identified" … "as per Uniform Relocation Assistance and Real Property Acquisition Policies Act and its applicable regulations (49CFR Part 24)".

Comment 8

The above discussion regarding the designated COPR sites in the Study Area is also relevant for this section, including health and safety measures, contaminated materials management, disturbance of nearby wetlands areas, maintaining structural integrity of the dike (i.e., Hackensack River Access Rd.) along the western flank of the River, and coordination with ongoing remedial investigation and remedial action activities at the COPR sites.

Item 9

Scoping Document – December 2006

Figures 2 and 3

Comment 9

Figures 2 and 3 of the Scoping Document have a discrepancy with Figures S-1 and S-4 of the Executive Summary. The Swift Interlocking designation in Figures 2 and 3 is located west of the I-95 /NJ Turnpike at the junction of the Northeast Corridor and the line to Hoboken (marked with "13 trains"). On Figures S-1 and S-4, this location is designated "Kearny Junction Interlocking". The Swift Interlocking designation in Figures S-1 and S-4 is shown east of the I-95/NJ Turnpike on the Northeast Corridor only.

Item 10

Scoping Document

The air quality analysis will include the following tasks: (p. 12)

Comment 10

The list of tasks addresses (a) existing ambient air quality, (b) regional ("mesoscale") air quality in terms of CO, VOCs, PM, and NOx, (c) screening analysis for CO, and (d) Transportation Conformity analysis for consistency with State Implementation Plans as per Clean Air Act amendments. These appear to be long-term impacts only. Based on the alternatives shown, there will be significant disturbance of lands adjacent to the current Northeast Corridor that are filled with anthropogenic materials, including COPR. COPR contains elevated concentrations of Cr(VI) that is a known human carcinogen by inhalation and can cause allergic contact dermatitis to Cr(VI)-sensitized individuals. At the present time, the COPR fill on the aforementioned sites exists under caps that preclude human exposure to particulate-bearing Cr(VI). Any activities that disturb the caps or the underlying COPR will have to provide for protection of construction workers and nearby property occupants, regardless of the selected portal bridge alternative, and will have to address appropriate management of disturbed COPR.

Item 11

EDR Report – D1_2007 EDR Report

Comment 11

On p. 18, there are only 4 sites on the NJ "Chrome" list: Sites 47, 50 ("Janetex" should be spelled "Janatex") 58, and 116. Sites 48, 59, 103, 113, and 131 are missing from the list.

Item 12

EDR Report Map locations – D2_2007 EDR Map

Comment 12

Sites 47 and 58 are located at point 15 along Belleville Turnpike, north of Amtrak RR, near communication towers adjacent to Janatex swamp. See Figure A for correct location of these sites south of the Northeast Corridor and west of Belleville (Newark) Turnpike.

Site 116 is located at point 17, just north of Amtrak Northeast Corridor, rather than South of the Northeast Corridor.

Re: Portal Bridge DEIS Comments

Dear Mr. Wilkins,

The following comments address the navigational acceptability of the bridge alternatives proposed in the Draft Environmental Impact Statement (DEIS) for the Portal Bridge Project, dated February 2008. The United States Coast Guard in its bridge permitting responsibility cannot approve the location and clearances of any bridge structure until formal application is received and we have conducted our public review process. However, as a Cooperating Agency we have reviewed the studies and analyses that form the basis for the DEIS.

The various alternatives presented in the DEIS include combinations of fixed and movable bridges that provide 50 feet vertical clearance above Mean High Water for the northern, fixed bridge, and 40 feet vertical clearance above Mean High Water for the southern, moveable bridge (in the closed position). Data logs for the Portal Bridge from April 2004 to April 2006 show that of the 663 bridge openings in that period, the average vertical clearance required for vessels was 27 feet (the smallest being 18 feet) with the greatest vertical clearance required being 49 feet. Therefore, it is the Coast Guard's opinion that the suggested alternatives would likely provide reasonable navigational clearances for present and prospective vessel traffic along the Hackensack River.

It should be noted that comments from interested parties at the recent DEIS public hearing called for "fixing" Amtrak's existing Portal swing bridge in the closed position. One party called for fixing the bridge at 40 feet above Mean High Water, and one party called for fixing the bridge at its current height, 23 feet above Mean High Water[1]. These are both unacceptable options to the Coast Guard. In light of the information available through the bridge data logs neither of these options would provide for current or reasonable, future navigational needs of the Hackensack River.

We will continue to assist in our role as Cooperating Agency for this project. Thank you for this opportunity to comment.

Sincerely,

Gary Kassof
Bridge Program Manager
First Coast Guard District
By direction of the District Commander

[1] Statement from Institute for Rational Urban Mobility, Inc., President, George Haikalis, submitted on March 18, 2008, at the Portal Bridge DEIS Hearing.

UNITED STATES DEPARTMENT OF COMMERCE

74 Magruder Road
Highlands, NJ 07732

March 31, 2008

John Wilkins
The New Jersey Transit Corporation
One Penn Plaza East
Newark, NJ 07105

Dear Mr. Wilkins:

The National Marine Fisheries Service (NMFS), Northeast Region, Habitat Conservation Division has reviewed the February, 2008 Draft Environmental Impact Statement (DEIS) for the Portal Bridge Capacity Enhancement Project. The National Railroad Passenger Corporation (Amtrak) and New Jersey Transit Corporation (NJT) have proposed to enhance the capacity and to improve the operation of the Portal Bridge, a rail crossing over the Hackensack River between Kearny and Secaucus in Hudson County, New Jersey. The existing Portal Bridge is a two-track, movable swing-span bridge that began operation in 1910. Due to the age of the bridge, maintenance difficulties, capacity constrains, operational inflexibility and conflicts with maritime uses, NJT and Amtrak are proposing to replace the Portal Bridge. The Federal Railroad Administration (FRA) and NJT prepared this DEIS to analyze the potential environmental impacts of the proposed project.

The project alternatives discussed in the DEIS include the no action alternative and several build alternatives. All of the build alternatives include designs for the construction of both a three-track fixed bridge and a two-track movable bridge with the removal of the existing portal bridge. The differences among the alternatives are mainly the alignments of the new bridges in relation to the existing bridge and the alignment of track 5. In addition to the replacement of the Portal Bridge, the build alternatives would also require the construction of a new track configuration between the Swift Interlocking and the Secaucus Transfer Station. This reconfiguration will include providing a minimum of four tracks between these two areas and a grade separated crossing of track 5 over of under the Northeast Corridor. Also included in the build alternatives are new rail bridges over Newark Turnpike, the former Erie-Paterson Branch right-of-way, Belleville Turnpike, the former Erie Arlington Branch right-of-way and the Booton Line.

Our comments on the DEIS are as follows:

Magnuson Stevens Act – Essential Fish Habitat
The project area has been designated as essential fish habitat for a variety of federally managed species including red hake (*Urophycis chuss*), winter flounder (*Pseudopleuronectes americanus*), windowpane (*Scopthalmus aquosus*), Atlantic sea herring (*Clupea harengus*), bluefish (*Pomatomus saltatrix*), Atlantic butterfish (*Peprilus triacanthus*), summer flounder (*Paralicthys dentatus*) and black sea bass (*Centropristis striata*). The DEIS lacks any discussion of the impacts of the proposed project on essential fish habitat (EFH). Section 305(b)(2) of the Magnuson Stevens Act (MSA) requires all federal agencies to consult with the NMFS on any action authorized, funded, or undertaken by that agency that may adversely affect EFH. Included in this consultation process is the preparation of a complete and appropriate EFH assessment to provide necessary information on which to consult. Our EFH regulation at 50 CFR 600.905 mandates the preparation of EFH assessments and generally outlines each agency's obligations in this consultation procedure.

In accordance with the EFH Final Rule published in the Federal Register on January 17, 2002, federal agencies may incorporate an EFH assessment into documents prepared for another purpose including National Environmental Policy Act documents such as this DEIS. If an EFH assessment is to be contained in another document, it must include all of the mandatory components of an EFH assessment as outlined in the EFH final rule, and it must be clearly identified as an EFH assessment. The mandatory contents of an EFH assessment include a description of the action, an analysis of potential effects if the action on EFH and the managed species, the federal agency's conclusion regarding the effects of the action on EFH and proposed mitigation, if applicable. Additional information that should be include in the EFH assessment as appropriate includes the results of on-site inspections to evaluate the habitat and the site specific effects of the project, the views of recognized experts on the habitat or the species that may be affected, a review of pertinent literature and related information and an analysis of alternatives to the action. Such analysis should include alternatives that could avoid of minimize adverse effects on EFH.

The DEIS does not include an EFH assessment as required in the EFH Final Rule. As a result, the lead federal action agency, in this case the FRA must either provide NMFS with a separate EFH assessment or include one in a revised DEIS. The lead federal agency may designate a non-federal representative to conduct the EFH consultation by giving written notice of such designation to NMFS. If a non-federal agency representative is used, the federal action agency remains ultimately responsible for compliance with Sections 305 (b) (2) and 305 (b) (4) (B) of the MSA.

Chapter 5.1 Land Use and Social Conditions
The build alternatives would all require an increase in the size of the existing right-of-way thought the project area. This would involve the acquisition and conversion to transportation use several areas of parkland and wetland preserve along the right-of-way. This includes the Cedar Creek Marsh, the Kearny Brackish Marsh/Cayuga Dike, the Riverbend Wetland Preserve and the Hudson County Park at Laurel Hill. Some of these areas may have been acquired by the New Jersey Meadowlands Commission (NJMC) as part of a compensatory mitigation package for fills authorized elsewhere in the Meadowlands District, or federal funds may have been used to construct some park facilities. If this is the case, additional approvals to impact the area may be required, or additional compensation above the required wetlands mitigation may be necessary. To determine what, if any additional measures are needed, NJT should coordinate with the NJMC and Hudson County.

Chapter 5.6 Ecology
C. Existing Conditions
Under the section "Anadromous Species," on page 5.6-14 and 15, please note that alewife (*Alosa pseudoharengus*) and blueback herring (*Alosa aestivalis*), collectively called river herring have been designated as species of concern by NMFS in a Federal Register Notice dated October 17, 2006 (71 FRN 61022) because landing statistics and the number of fish observed on annual spawning runs indicate a drastic decline in river herring populations throughout much of their range since the mid-1960's. "Species of concern" are those species about which NMFS has some concerns regarding status and threats, but for which insufficient information is available to indicate a need to list the species under the ESA. Both of these anadromous fish species occur in the Hackensack River and spawn in the river's upper freshwater reaches.

In the section "Threatened and Endangered Species," on page 5.6-16, the citation "Green 2007" is incorrect. It should be "Greene 2007."

F. Mitigation
This section of the DEIS states, "based on preliminary discussions with the NJMC, the MIMAC, the Meadowlands Conservation Trust, and other natural resource agencies and involved parties, the Kane Tract (previously known as the Empire Tract) has been identified as a potential wetland restoration site." This statement is misleading and does not interpret the guidance on compensatory mitigation provided by the Meadowlands Interagency Advisory Committee (MIMAC) of which NMFS is a member. NJT has attended

several MIMAC meetings over the past few years to update the agencies on the MIMAC (NMFS, EPA, the US Fish and Wildlife Service, the NJMC, the Army Corps of Engineers and the New Jersey Department of Environmental Protection). The MIMAC has indicated that compensatory mitigation for unavoidable impacts to wetlands and waters of the United States would be necessary. NJT suggested the use of the Kane Tract. The MIMAC has cautioned NJT for this project as well as the Access to the Region's Core project, that the MIMAC has not received any proposal to construct a mitigation bank on the Kane Tract from the property owners, the Meadowlands Conservation Trust or any other entity. The development of a mitigation bank is a long and complex process. While it is possible that a compensatory mitigation bank could be developed on the site at some point, no bank exists now and it is not likely that a mitigation bank will be approved at the site before NJT needs to have its compensatory mitigation plan identified for its permits and for construction. On several occasions, the MIMAC suggested to NJT that they look elsewhere for suitable mitigation site. Another option could be to design a stand-alone compensatory mitigation project at the Kane Tract that would not be included in any future bank.

Chapter 6 Construction Impacts

Page 6-22 of the DEIS states that in-water construction activities will not be conducted during the period identified as anadromous fish spawning period, typically April through June. We agree that avoiding work during the period of anadromous fish migration and spawning will reduce impacts to anadromous species such as alewife (*Alosa pseudoharengus*) and blueback herring (*Alosa aestivalis*). However, please note that the dates for the anadromous fish migration and spawning runs in the Hackensack are likely to be from March 1 to June 30 of each year, not April 1 to June 30.

On page 6-25, the DEIS states that the project would include the relocation of Amtrak's power lines that run along the Northeast Corridor. If this relocation involves impacts to wetlands or waters of the United States, these impacts should be included in the DEIS.

Thank you for the opportunity to comment on the DEIS. We look forward to additional coordination on this project. If you have any questions, please contact Karen Greene at 732 872-3023.

Sincerely,

Stanley W. Gorski
Field Offices Supervisor

United States Department of the Interior

OFFICE OF THE SECRETARY
Washington, DC 20240

TAKE PRIDE IN AMERICA

APR 17 2008

9043.1
PEP/NRM

ER 08/155

Mr. David Valenstein
U.S. Department of Transportation
Federal Railroad Administration
1200 New Jersey Avenue, SE
Washington, DC 20590

Dear Mr. Valenstein:

This is in response to a request for the Department of the Interior's (Department) review and comment on the Draft Environmental Impact Statement (DEIS) and Section 4(f) Evaluation for the **Portal Bridge Capacity Enhancement Project, Hudson County, New Jersey.** The proposed action consists of the replacement of a rail bridge (Portal Bridge) over the Hackensack River located between the Cities of Kearney and Secaucus, Hudson County, New Jersey. We offer the following comments on this project for your consideration.

SECTION 4(f) EVALUATION COMMENTS

The Department concurs that there is no prudent and feasible alternative to the proposed use of Section 4(f) properties including the Portal Bridge and portions of the Pennsylvania Railroad Historic District by each of the build alternatives. Additionally, each of the build alternatives requires construction and excavation within the area of the Historic Cemeteries of Hudson County that have the potential to contain human remains. However, additional engineering and resource investigations are needed to determine the exact extent of the resource and construction effects, and the extent of mitigation required.

The measures to minimize harm to the historic resources must be explicitly consistent with the Memorandum of Agreement developed with the New Jersey State Historic Preservation Office and the Federal Railroad Administration (FRA). We recommend that a signed copy of that agreement documenting compliance with Section 106 of the National Historic Preservation Act be included in the final documentation for this project to reflect the procedures for protecting cultural resources determined in consultation with the New Jersey State Historic Preservation Officer.

Additionally, the build alternatives for the Portal Bridge Project will require acquisition of approximately two acres of Laurel Hill Park owned by Hudson County and the New Jersey Meadowlands Commission. Appropriate mitigation measures for the loss of this open space area will need to be developed in conjunction with Hudson County and the New Jersey Meadowlands Commission.

FISH AND WILDLIFE COORDINATION

The U.S Fish and Wildlife Service (FWS) attended interagency scoping meetings with the Federal Railroad Administration (FRA), the lead Federal agency, on several occasions with the Corps of Engineers, New York District (Corps); the National Marine Fisheries Service (NMFS); the U.S. Environmental Protection Agency (USEPA); the New Jersey Meadowlands Commission (NJMC); and the New Jersey Department of Environmental Protection (NJDEP) to discuss potential adverse impacts to fish and wildlife resources. Project impact concerns were discussed in an FWS letter to the applicant dated February 2, 2007 (copy attached).

The following comments on the proposed activity are provided pursuant to the National Environmental Policy Act of 1969 (NEPA) (83 Stat. 852; 42 U.S.C. 4321 *et seq.*), Fish and Wildlife Coordination Act (48 Stat. 401, as amended; 16 U.S.C. 661 *et seq.*), Migratory Bird Treaty Act of 1918 (40 Stat. 755, as amended; 16 U.S.C. 703-712), Section 7 of the Endangered Species Act of 1973 (ESA) (87 Stat. 884, as amended; 16 U.S.C. 1531 *et seq.*) (ESA), and are consistent with the intent of the FWS's Mitigation Policy (Federal Register Vol. 46, No. 15, Jan. 23, 1981). The FWS's Mitigation Policy emphasizes that avoidance and minimization precede compensation, which is to be considered for unavoidable adverse impacts to fish and wildlife resources and supporting ecosystems. The following does not preclude additional comments to the Corps pursuant to FWCA or ESA on any related application(s) for Department of the Army permits.

The above referenced meetings allowed the regulatory and resource agencies to discuss the project and identify potential adverse impacts to fish and wildlife resources. The FWS has offered the following comments and concerns to continue Departmental assistance in the planning process and for incorporation in the FRA NEPA document. The Department recommends that any concerns, including the development of a mitigation plan, be resolved prior to finalizing the subject EIS.

SPECIFIC COMMENTS

Federal Listed Species

The applicant previously consulted with the FWS pursuant to the ESA. The FWS concluded in its February 2, 2007, letter that the subject proposal would *not* adversely affect a federally-listed species.

No further consultation pursuant to Section 7(a)(2) of the ESA is required by the FWS. If project plans change, or if new information is obtained that indicates the occurrence of a federally listed species at the proposed project site(s), this determination may be considered.

The FWS provides the above determination with respect to federally-listed or proposed threatened or endangered flora and fauna under FWS jurisdiction only. The proposed project is located on the Hackensack River and may affect the federally-listed shortnose sturgeon (*Acipensor brevirostrum*). Principal responsibility for threatened and endangered marine species is vested with the NMFS.

Alternatives Analysis

The proposed project poses individual and cumulative impacts on the aquatic environment as the project may fill upwards of 15 acres of estuarine wetlands. The DEIS references several methods to minimize fills, however, the total amount of fill has yet to be quantified. Any final actions regarding fill discharge in waters of the U.S. must be in compliance with the Section 404 (b)(1) Guidelines of the Clean Water Act (33 U.S.C. 1344 *et seq.*).

The Department recommends the FRA consider alternatives to the proposed project, including using best available technology to reduce any fill proposed in the aquatic environment. If an alternative is deemed viable and involves any adverse impacts to the aquatic environment, the Department recommends that the FRA develop a comprehensive mitigation plan with the FWS, NMFS, EPA, NJMC, and NJDEP to offset the expected adverse impacts to aquatic resources, prior to the completion of the FEIS.

Impacts to Anadromous Fish and Other Aquatic Organisms

The NJDEP (2000) confirms that the Hackensack River provides habitat for river herring (*Alosa sp.*), striped bass (*Morone saxitilis*), Atlantic sturgeon (*Acipensor oxyrinchus*) and the federally- listed shortnose sturgeon. Potential adverse impacts include pile driving, dredging, bulkheading, and wetlands filling, which can contribute to turbidity, sedimentation, and decreased water quality. Increased turbidity and river sedimentation can interfere with the various life stages of anadromous fishes, including migration and spawning.

The Department recommends that the FRA continue coordinating with the FWS, NMFS, and NJDEP to determine if seasonal restrictions or other requirements are necessary to avoid adverse impacts to aquatic organisms. At a minimum, the Department recommends avoiding all in-water work from April 1 to June 30, to protect anadromous fish.

Compensatory Mitigation

The Department has not had an opportunity to review any mitigation plans proposed for the project. The DEIS contains numerous references that all mitigation would be discussed during the regulatory permitting process; however, compensatory mitigation, proposed to offset unavoidable adverse impacts, must be evaluated during the NEPA planning process in order

to assess net impacts from the project. The CEQ's (1981) guidance states that an EIS should present not only a full range of environmental impacts but also a full spectrum of appropriate mitigation. In addition, a mitigation plan (when necessary) is generally required prior to the issuance of Corps and NJDEP authorizations. In addition, the FWS is unaware of any mitigation efforts being proposed at the Kane Tract, contrary to a reference in the DEIS that the Kane Tract is being considered (pp 7-13, Secondary and Cumulative impacts). Therefore, the Department requests development of a mitigation plan *prior* to the finalization of the subject EIS.

Contaminants

The project site adjoins several heavily contaminated areas of the Hackensack Meadowlands (pp. 5.7-15, Contaminated Materials). The Department recommends that the FRA contact the USEPA and NJDEP to determine if the siting of the Portal Bridge project would compromise any efforts to remedy these contaminated properties.

CONCLUSIONS AND RECOMMENDATIONS REGARDING FISH AND WILDLIFE RESOURCES

The Department finds the FRA DEIS incomplete in discussing project impacts, compensatory mitigation, alternatives analysis, and potential conflict with contaminated site remediation. Further information must be collected in order to determine individual and cumulative adverse impacts to the aquatic environment, and the level of mitigation required to compensate for any unavoidable adverse impacts should be quantified. The Department recommends any future FRA NEPA document include the following.

General Recommendations

Resolve all FWS concerns *prior* to issuing the final EIS, including the development of a comprehensive mitigation plan.

Specific Recommendations

1. Conclude consultation with the NMFS regarding the federally listed shortnose sturgeon.

2. Consider, and present in the EIS, alternatives to the proposed project, including the use of best available technology to reduce any fill in the adjacent wetlands.

3. Coordinate with the FWS, NMFS, and NJDEP to determine if seasonal restrictions or other requirements are necessary to protect anadromous fish. At a minimum, all in-water work should be restricted from April 1 through June 30 to protect anadromous fish.

4. Contact the USEPA and NJDEP to determine if the subject Portal Bridge project would compromise any efforts to remedy the identified adjacent contaminated properties.

The Department recommends that the FRA continue close coordination with the FWS's New Jersey Field Office to ensure that fish and wildlife concerns are comprehensively addressed during preparation of the EIS. For further information concerning FWS comments, please contact Mr. John Staples or Mr. Steven Mars at 609.646.9310, extension 12 or 23 respectively.

We appreciate the opportunity to provide these comments.

Sincerely,

Willie R. Taylor
Director, Office of Environmental
Policy and Compliance

FEB 0 2 2007

Ms. Christie Marcella
Portal Bridge Capacity Enhancement Project
c/o Howard/Stein-Hudson Associates, Inc.
517 West 35th Street, 7th Floor
New York, New York 10001

Dear Ms. Marcella:

The U.S. Fish and Wildlife Service (Service) has reviewed the Scoping Document for the proposed Portal Bridge Capacity Enhancement project located in Kearny and Secaucus, Hudson County, New Jersey.

AUTHORITY

This response is provided pursuant to the National Environmental Policy Act of 1969 as amended (83 Stat. 852; 42 U.S.C. 4321 *et seq.*) (NEPA), the Endangered Species Act of 1973 (87 Stat. 884, as amended; 16 U.S.C. 1531 *et seq.*) (ESA), the Migratory Bird Treaty Act of 1918 (40 Stat. 755, as amended; 16 U.S.C. 703-712), and consistent with the intent of the Service's Mitigation Policy (*Federal Register*, Vol. 46, No. 15, Jan. 23, 1981). These comments do not preclude separate review and comments by the Service pursuant to the Fish and Wildlife Coordination Act (48 Stat. 401, as amended; 16 U.S.C. 661 *et seq.*) or future review pursuant to NEPA.

BACKGROUND

The Federal Railroad Administration (FRA) (lead federal agency), Amtrak, and the New Jersey Transit Corporation propose to improve or replace the nearly 100-year-old Portal Bridge, which is a two-track, moveable swing-span rail bridge over the Hackensack River. On December 12, 2006, the FRA issued a Notice of Intent (NOI) to prepare an Environmental Impact Statement pursuant to NEPA. Alternatives under consideration include replacement, rehabilitation or modification of the existing bridge along with the construction of an additional bridge for added capacity. The general purpose of the project is to address mechanical, operational, maintenance, and capacity problems with the existing bridge. The Portal Bridge project is being coordinated with planning for the Access to the Region's Core (ARC) project, which involves a new passenger rail tunnel under the Hudson River and other new rail infrastructure.

Thank you for the opportunity to review the Scoping Document. Please contact Wendy Walsh of my staff at (609) 646-9310, extension 48 if you have any questions regarding the above Service comments.

Sincerely,

John C. Staples
Assistant Supervisor

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY
REGION 2
290 BROADWAY
NEW YORK, NY 10007-1866

MAR 3 1 2008

Mr. John Wilkins
The New Jersey Transit Corporation
One Penn Plaza East
Newark, New Jersey 07105

Dear Mr. Wilkins:

The U.S. Environmental Protection Agency (EPA) has reviewed the Federal Railroad Administration's (FRA) draft environmental impact statement (DEIS) for the Portal Bridge Capacity Enhancement (CEQ # 20080050). The proposed project would enhance the capacity and improve the operation of the Portal Bridge, a rail crossing over the Hackensack River in Hudson County, New Jersey. This review was conducted in accordance with Section 309 of the Clean Air Act, 42 U.S.C. 7609, and Section 102(2)(C) of the National Environmental Policy Act (NEPA), 42 U.S.C. 4332(2)(C).

The existing Portal Bridge is a two-track, moveable swing-span bridge that was constructed by the Pennsylvania Railroad and began operation in 1910. It is a critical infrastructure element for Amtrak and New Jersey (NJ) Transit on the Northeast Corridor. The DEIS examines four build alternatives in addition to the "no build" scenario. The build alternatives involve two new bridges to replace the existing bridge and differ primarily with respect to the location of the southern bridge and the type of grade-separated crossing, either track fly-over or duck-under, included to improve railroad operations. However, the DEIS does not indicate a preferred alternative.

In general, EPA is supportive of public transportation projects because of their potential to improve air quality, reduce congestion, and provide opportunities for energy efficiency. Nevertheless, we note throughout the DEIS, the FRA has stated that NJ Transit and Amtrak will coordinate with stakeholders to determine appropriate mitigation after a preferred alternative is selected and "once engineering design has sufficiently progressed." However, it is a requirement of the National Environmental Policy Act (40 CFR 1502.16(h)) that the NEPA document include a discussion of the "means to mitigate adverse environmental impacts." Accordingly, mitigation plans for impacts to wetlands, benthic habitat, historic/cultural areas or structures, open space, and noise must be included in the final environmental impact statement (FEIS).

EPA's technical comments on the DEIS are as follows:

Air Quality

1) The Portal Bridge DEIS concludes that the general conformity de minimis thresholds are not exceeded during the construction phase of the project; however, it does not provide any supporting information. In a January 10, 2008, response to previous EPA comments, FRA indicated that estimates were based on emissions per dollar value of construction using three Lower Manhattan recovery projects as models. EPA has the following comments with respect to general conformity:

a) Once the preferred alternative is selected, a general conformity applicability analysis and subsequent conformity determination, if warranted, must be conducted.

b) We do not agree with the use of dollar value of construction as a surrogate for emissions for a project of this size, cost, and construction duration. In addition, the Lower Manhattan recovery projects all incorporated specific clean diesel commitments to reduce emissions, and those commitments do not appear to have been included as mitigation strategies for the Portal Bridge project.

c) We anticipate a substantially different mix of non-road equipment will be used during the construction phase of the Portal Bridge project from that which was used in Lower Manhattan. Specifically, the DEIS states that material delivery and disposal, and construction of the bridge piers will be accomplished using barges, and we expect there would be at least one tug in operation. Delivery of other materials along with track and overhead wire work would be accomplished using trains. The Lower Manhattan projects did not utilize such marine and locomotive engines; therefore a project-specific, detailed emissions inventory should be completed for the Portal Bridge preferred alternative construction phase as the basis for a general conformity applicability determination.

d) Sulfur dioxide (SO_2) is a $PM_{2.5}$ precursor and must also be addressed in the general conformity determination.

2) The discussion of EPA's "Clean Air Non-Road Diesel Rule" on page 6-16 implies that the rule would require after-market retrofits of Tier 2 non-road engines. This is not true for Tier 2-certified engines. However, FRA can ensure that the cleanest diesel engines are used during construction by adopting clean diesel practices as air quality mitigation measures and enforcing those measures through its construction contracts. For example, measures could include a requirement that the cleanest engines be used on non-road construction equipment (Tier 4 engines may be available during the project's construction phase), use of best available retrofit technology for older engines, a site-wide idling minimization plan, or site electrification to reduce the use of diesel-powered

generators. We note that while the project site is not adjacent to residences, where localized impacts would be of greatest concern, it is close to Laurel Hill Park, where children may be exposed to increased concentrations of particulate matter and air toxics for the duration of the project's construction.

Wetlands

1) As stated earlier, no preferred alternative has been identified in the DEIS. In order to satisfy the Clean Water Act Section 404 requirements, the FEIS will need to identify a preferred alternative. If the preferred alternative has greater wetlands impacts than other practicable alternatives, the FEIS must explain why alternatives having fewer impacts were not selected. In addition, the FEIS will need to identify, map, and quantify acreages of each type of wetland that are proposed to be permanently impacted, temporarily impacted, fragmented or permanently shaded.

2) EPA is also concerned by the statement, "the ARC project was considered in the development of the feasible Portal Bridge build alternatives and is considered for its potential to cause cumulative effects." The FEIS should explain how this affects the acreage of wetlands impacted by the project. While earlier reports recommended two bridges with two tracks each, as a replacement for the existing Portal Bridge, the build alternatives in the DEIS recommend two bridges, including one with three tracks. The FEIS must demonstrate the necessity of the third track due to rail volume or safety reasons.

3) In Chapter 5.6, E., the term "regulated wetland buffer" should be defined.

Green Acres

As stated in the DEIS, approximately 2 acres of Laurel Hill Park will have to be acquired as part of all of the build alternatives. In order to divert Green Acres parkland or open space, the property owner (in this case Hudson County) must submit an application for approval from the Commissioner of the New Jersey Department of Environmental Protection and the State House Commission. The diversion process and a mitigation plan for the loss of this property as open space should be described in the FEIS, and compared to the estimated construction start time.

Noise

All four build alternatives would have moderate and severe noise impacts on the expanded Laurel Hill Park. The areas of moderate and severe noise impact should be visually represented on a map of the area to provide for a greater understanding of the impacts. Also, the DEIS does not discuss the possible impacts of increased noise on the fauna of the area. Furthermore, noise should also be analyzed under the cumulative impacts section of the document and include the increase in train traffic expected with the Access to the Region's Core project. Any mitigation for these impacts should be included in the FEIS.

Cumulative Impacts

The cumulative impacts section of the DEIS should quantify all known and reasonably foreseeable impacts to the wetlands in the Hackensack Meadowlands. While the DEIS lists some of the expected projects in the Meadowlands, none of the wetland impacts from these projects are quantified. Moreover, the DEIS should quantify expected wetlands losses from other transportation projects, such as the Teterboro Airport Runway Safety project.

Based upon our review, we are rating each of the four build alternatives as EC-2 (Environmental Concerns - Insufficient Information, see enclosed), due to the lack of a General Conformity analysis and mitigation plans, especially one to address impacts to wetlands.

Thank you for the opportunity to comment on the DEIS. If you have any questions, please call Lingard Knutson of my staff at (212) 637-3747.

Sincerely yours,

John Filippelli, Chief
Strategic Planning Multi-Media Programs Branch

Enclosure

cc: D. Valenstein, USDOT-FRA

SUMMARY OF RATING DEFINITIONS AND FOLLOW-UP ACTION
Environmental Impact of the Action

LO-Lack of Objections

The EPA review has not identified any potential environmental impacts requiring substantive changes to the proposal. The review may have disclosed opportunities for application of mitigation measures that could be accomplished with no more than minor changes to the proposal.

EC-Environmental Concerns

The EPA review has identified environmental impacts that should be avoided in order to fully protect the environment. Corrective measures may require changes to the preferred alternative or application of mitigation measures that can reduce the environmental impact. EPA would like to work with the lead agency to reduce these impacts.

EO-Environmental Objections

The EPA review has identified significant environmental impacts that must be avoided to provide adequate protection for the environment. Corrective measures may require substantial changes to the preferred alternative or consideration of some other project alternative (including the no action alternative or a new alternative). EPA intends to work with the lead agency to reduce these impacts.

EU-Environmentally Unsatisfactory

The EPA review has identified adverse environmental impacts that are of sufficient magnitude that they are unsatisfactory from the standpoint of environmental quality, public health or welfare. EPA intends to work with the lead agency to reduce these impacts. If the potential unsatisfactory impacts are not corrected at the final EIS stage, this proposal will be recommend for referral to the Council on Environmental Quality (CEQ).

Adequacy of the Impact Statement

Category 1-Adequate

EPA believes the draft EIS adequately sets forth the environmental impact(s) of the preferred alternative and those of the alternatives reasonably available to the project or action. No further analysis or data collection is necessary, but the reviewer may suggest the addition of clarifying language or information.

Category 2-Insufficient Information

The draft EIS does not contain sufficient information for EPA to fully assess environmental impacts that should be avoided in order to fully protect the environment, or the EPA reviewer has identified new reasonably available alternatives that are within the spectrum of alternatives analyzed in the draft EIS, which could reduce the environmental impacts of the action. The identified additional information, data, analyses, or discussion should be included in the final EIS.

Category 3-Inadequate

EPA does not believe that the draft EIS adequately assesses potentially significant environmental impacts of the action, or the EPA reviewer has identified new, reasonably available alternatives that are outside of the spectrum of alternatives analyzed in the draft EIS, which should be analyzed in order to reduce the potentially significant environmental impacts. EPA believes that the identified additional information, data, analysis, or discussions are of such a magnitude that they should have full public review at a draft stage. EPA does not believe that the draft EIS is adequate for the purposes of the NEPA and/or Section 309 review, and thus should be formally revised and made available for public comment in a supplemental or revised draft EIS. On the basis of the potential significant impacts involved, this proposal could be a candidate for referral to the CEQ.

Ferry may return to South Amboy

BY JOHN MAJESKI
STAFF WRITER

SOUTH AMBOY: Commuters should have no reason to doubt ferry service will resume in this Raritan city, officials say.

"Let me tell you something: If it doesn't come back ... I'll quit," said Stanley Jaremczyk, South Amboy's economic development consultant. "We're working too long and too hard at making all this stuff work."

In fact, Jaremczyk said the city is likely weeks away from inking a deal with the Circle Line company to provide service between South Amboy and lower Manhattan. Boats could start running by the end of the calendar year — when a roadway connecting Lower Main Street to the waterfront is completed.

Negotiations between the city and Circle Line could not be confirmed with the ferry operator Friday.

A multimillion-dollar federally funded ferry terminal will not be ready until summer 2006, Jaremczyk said, so South Amboy would be forced to re-open the temporary terminal at the old Atlantic Energy site in the south and of town. That is the same location where New York-bound passengers boarded ferries before Hurricane Sandy struck the area in 2012, damaging the pilings and the piers.

In 2013, Seastreak announced it was pulling out of the city, citing low-to-non-existent ridership and a spike in fuel costs. South Amboy scrambled to find a replacement.

See Ferry Page A6

Turns out South Amboy's bar bragging rights may be merely a myth

South Amboy has joined the ranks of Hollywood's favorite mascot, Devil and other tall tales.

1. Most of the first things I heard about South Amboy were that it was super bad year was how this little city — as it's been called — had the end record for most bars per capita.

Meets, editors and outsiders alike spouted on about this watering hole and that.

Newspaper articles made passing mention of such a record, though one local politician dialled it up as mere rumor.

I contacted Ripley's Believe It or Not! in New York, I assure you, such information is of the utmost importance to us," came the e-mail reply 20 minutes later.

The archivist's initial search on "Amboy" did produce some tantalizing leads, including a 1933 Plymouth Rock Inn owned by a Michael Sharry of South Amboy, who gave a Sneed to birthday party attendees that "he would do something to a March 16, 1933, cartoon.

And one from Feb. 20, 1977, noted North Amboy's John Pagnotenelle found the color of his eyes changed from brown to blue after surviving a chemical explosion.

Useless trivia for sure. But not the nugget I was hunting down.

I persisted with Ripley's, asking them to check again under various word combinations and phrases, still with no success. Finally, I called South Amboy's library. Workers there — like other locals I had contacted — were familiar with the claim, but couldn't remember where or when they heard it. The library later fared over a new article from the early '90s and a reader's letter. However, the only evidence they could find was a 1933 Ripley's cartoon.

Gulliness, in its search, had challenge when I made my request. "If some of the old-timers in town don't remember it, then I don't know who will. I'll have to get them on the couch with us," a women said.

I had hoped to write about the origin of the claim, but it never changed in South Amboy since the experts have unofficially gated this to local folklore.

They busted this myth.

And my original column.

John Majeski's favorite beer Guinness, believe it or not. He'd recollect at (732) 565-7286 or at j.majeski@...

---

construction related to the new docking area began.

Yet some riders were frustrated, asserting that outlooks were being disrupted by the operation during the summer. Some of the ferry's customers said they were unaware that No. 1 was a necessary part of the construction and doubted service would return at all.

But in May 2006, the service was restored. A permanent terminal at Atlantic Landing in South Amboy opened in 2007, and ferry service has been uninterrupted since.

Plans for the ferry and ferry terminal in South Amboy date back to the early 2000s, when the city was looking for ways to connect its residents to jobs in the Manhattan area. Ferry service was seen as a way to ease the burden on the Garden State Parkway and Route 9 bridges, which were packed with commuters trying to get to and from work in New York City.

Ferry service between South Amboy and Lower Manhattan was suspended after Hurricane Sandy in 2012 because the pilings and piers were damaged. Service was restored in 2013, but was suspended again in 2014 after the operator, Seastreak, said it was losing money on the route.

Plans to build a new ferry terminal in South Amboy were announced in 2014, and construction began in 2015. The terminal is expected to be completed in 2017.

Re: Portal Bridge Capacity Enhancement Project
Draft Environmental Impact Statement Comments

Dear Ms. Marcella:

Allow me to state that I support the overall thrust of the Portal Bridge Capacity Enhancement Project Draft Environmental Impact Statement (PBCEP DEIS), but would like to suggest that two additional considerations be incorporated into the the statement to improve its usefulness. These are:

- Increase in the Number of tracks on the Northern (Fixed) Bridge from Three to Four- As currently proposed the northern fixed bridge would have only three tracks. Given the amount of rail traffic currently flowing through this corridor and the amount of rail traffic anticipated to be generated over the next fifty years by various new passenger rail corridors proposed in both New Jersey and Pennsylvania (e.g., Monmouth-Ocean-Middlesex Line and Lackawanna Cutoff-Pocono Line are just two which come readily to mind) which would ultimately feed into this corridor, I think it would be prudent to increase the number of tracks on the northern fixed bridge from three to four. This would provide maximum flexibility in rerouting trains if for some reason a track had to be closed due to breakdown or maintenance issues or if the southern lift bridge had to be taken out of service for an extended period. In essence, the northern bridge would function as an extension of the four-track Northeast Corridor "main" line to the existing New York Pennsylvania Station (NYPS) while the southern lift bridge would function as the two-track "feeder" line to the new stub-end 34th Street Pennsylvania Station Expansion (NYPSE) proposed as part of the Access to the Region's Core (ARC) project. Although a fourth track would increase the overall cost of the project, ultimately it would be forward-looking and cost effective in eliminating the need to add another track at a later date.

- Laurel Hill County Park Land Use Mitigation and Historic Resources Preservation - While the northern fixed bridge, regardless of the number of tracks it would carry, would inevitably require the condemnation of land newly-acquired for Laurel Hill County Park, abandonment of the existing Portal Bridge would provide an opportunity to mitigate the effects of the project upon the Pennsylvania Railroad Historic District. The proposed southern lift bridge should be sited on a new alignment away from the existing alignment. After removal of the existing swing span and pivoting drum from the Portal Bridge, a new high level hiking/biking "memorial" fixed replacement span should be designed to reconnect the two approach portions of the bridge and the bridge and its approach lands should be made a part of Laurel Hill County Park. This would serve the dual purposes of compensating Laurel Hill County Park for the loss of lands to the new fixed bridge alignment and at the same time preserve a scenic section of the Pennsylvania Railroad "High Line" for purposes of historic interpretation to the public. I am aware that proponents of the East Coast Greenway trail have been seeking an appropriate crossing of the Hackensack River. Perhaps this piece of the "High Line"could fulfill that purpose. Given that the remainder of the Pennsylvania Railroad Historic District will be substantially altered by this project, the Access to the Region's Core (ARC) project, and other improvement projects likely in the future, preserving this remnant as a historic vestige seems a worthy means of mitigation. The hiking/biking "memorial" replacement bridge would tie in well with the proposed interpretive exhibit commemorating both the existing Portal Bridge and the "High Line"(vide page S-21 of the Draft Executive Summary under "Historic Resources").

Thank you for this opportunity to comment on the Draft Environmental Impact Statement relating to this proposed project.

Respectfully,

Kevin M. Hale

Subject: Comments on Portal DEIS

I have the following observations to make on the Portal DEIS:

1. Independent Utility - Since the Portal project appears as part of the no build option of the THE Tunnel project it stands to reason that the Portal project in its entirety should have utility independent of the THE Tunnel project, i.e. it should have utility even if the THE Tunnel project is not built. It is not clear how the proposed Southern Bridge has such utility in the absence of the THE Tunnel project. If there is no THE Tunnel project there is virtually no conceivable use of the Southern Bridge and the Northern Bridge would appear to be more than adequate to address the traffic and reliability issues.

2. Lack of connection from NYPSE to NEC in the westbound direction - There is a lack of any straightforward connection that can be used by a train originating in NYPSE and destined for any location along the NEC or its branches like the RVL or NJCL. Presumably this is an oversight and a track 7 connecting track 5 to track 3 or 4, mirroring track 8 in the opposite direction should be added to the project to mitigate this omission.

3. Unfortunately the NEC still remains a 2 track railroad between Swift and Hudson thus creating a bottleneck. Consideration should be given to add a third track between Hudson and Swift, perhaps by extending a branch from track 1 at Hudson to connect to track 6 at Swift, thus providing a 3 track railroad all the way from Dock to Portal.

Thank you for your attention.

THE MODERATOR: Well, good afternoon, everybody. We are going to get everybody settled down so we can begin this portion of our hearing.

On behalf of the Federal Railroad Administration and Amtrak and New Jersey Transit, I would like to welcome you to this hearing. It's a public hearing on the Draft Environmental Impact Statement and Draft Section 4(f) evaluation for the proposed Portal Bridge Capacity Enhancement Project.

My name is Maura Fitzpatrick. I will be facilitating this hearing this afternoon.

We are going to begin with a short presentation and we are going to follow that by the public comment period with our stenographer here.

I just want to remind you that if you would like to speak for the record, you need to fill out a registration card out in the front desk with Melissa and Eric, but also we will take written comments. We have comment sheets for you or we will take written comments in any other form of writing, that fine.

We have information though on the comment sheet about where you can send your comments in until the close of business on the 31st of March.

So I will be coming back in a little bit to tell you more about the ground rules of the public comment portion of this.

But I would like to now introduce David Valenstein with the Federal Railroad Administration.

MR. DAVID VALENSTEIN: Thank you very much, Maura.

I'm David Valenstein. I represent the Federal Railroad Administration. We are very pleased to welcome you to this public hearing.

This is a very important bridge project to replace a vital component of the Northeast corridor infrastructure.

The Federal Railroad Administration is the lead federal agency for this EIS. And the project is a joint project between Amtrak and New Jersey Transit.

There are three cooperating agencies for this EIS: The Environmental Protection Agency, the U.S. Coast Guard and the Federal Transit

Administration.

New Jersey Transit established a Technical Advisory committee comprised of many federal and state agencies. And we have met with that committee and with a Regional Citizens Liaison Committee through the study.

We are here today to listen to you as you comment on this Draft EIS.

Now it gives me pleasure to introduce Amtrak's representative, Ken Kulick.

MR. KENNETH KULICK: Thank you, David. And good afternoon.

My name is Ken Kulick. I am the Amtrak Engineering Project Manager for the EIS portion of the Portal Bridge Replacement Project.

The existing Portal Bridge, which is about 100 years old, and it's owned by Amtrak, is a critical piece of the Northeast corridor infrastructure. Its replacement with a bridge that meets modern design standards and has sufficient capacity to deal with the future growth of rail traffic into New York City is really critical to the continued economic expansion of this area.

And now I would like to introduce

John Wilkins from New Jersey Transit.

MR. JOHN WILKINS: Thank you.

And I would also like to welcome you to today's meeting, which will be both at this time and approximately two hours from now we will repeat this process.

For the record, this meeting is part of the environmental review process for the proposed Portal Bridge Capacity Enhancement Project.

The review is being conducted in accordance with the National Environmental Policy Act, or better known as NEPA, and all of the applicable regulations that go along with it as set forth in - if you want to write this down - 40CRF Part 1500.

I would also like to acknowledge Mayor Santos of Kearny. We thank you very much for coming. And we will be seeing you next week.

Some of the other project people that are here that won't be speaking include Kevin Johns from M&M. I don't think there's anybody here from Gannett Fleming today, is there?

THE MODERATOR: That's correct.

MR. JOHN WILKINS: That's

correct. Tom Schulze, also from NJ Transit. I think that's most of the people who are directly involved with the project.

Amtrak and New Jersey Transit has been a team -- have a team of consultants that are actively working on this project. That team is headed by AKRF. And the main components of it are Gannet Fleming who is doing the tracking, signaling and M&M who is doing the actual bridge design. And then we have Howard/Stein-Hudson which has actually organized this meeting today.

As David mentioned, there are numerous federal, state and local agencies, with expertise in the environmental review process, that have ensured that the studies and evaluations of the EIS are in conformance with existing law and regulations.

You the public are an essential part of this process. And we are here today to hear your comments, perspectives and recommendations.

As you have seen, we have informal boards and project staff available in the open house area. Actually, we have some of the boards here which depict the four alternatives that we are now

considering. And then there's additional information through the doors there.

We also have materials about the DEIS in the sign-in area. If you saw those piles, that's what I'm referring to, which you're most welcome to. There are copies of the DEIS there. I think both in hard copy, if they're still any left, and also on CDs.

For those of you who have not been to a DEIS public hearing before, the purpose of this hearing is to gather information and comments with regard to the DEIS which we have previously made available. I think that was issued on February 15th of last month.

As such, we will not respond to your comments here but will in the full EIS. We are just seeking comments tonight relative to the Portal Bridge Project only. In other words, we are here to listen to you.

At this point I would like to turn the podium over to Robert Conway who will make this presentation.

MR. ROBERT CONWAY: Thank you, John.

I'm going to give a presentation. Hopefully, I'll go through it rather quickly. I'm a little under the weather.

And also we've had some -- some of my partners here talk about some of the things I was going to talk about and so hopefully we will go through this quickly.

Minnie, you can go and skip this slide.

This was the slide -- the first slide in terms of the introduction of where the project is. It's hard to see probably in the back of the room, but basically this is the Portal Bridge over the Hackensack River.

To the east is Secaucus Station.

To the west off the map is Newark.

Minnie, next slide, please.

Currently, the importance of the Bridge.

As you heard both John and Ken talk about this, Amtrak and New Jersey Transit -- Amtrak owns the Portal Bridge and most of the Northeast corridor infrastructure. Amtrak carries approximately 16,000 passengers per day on more than

one hundred trains while New Jersey Transit has 400 trains, almost 400 trains in both directions with 150,000 passengers.

Next slide.

As David had mentioned, the Federal Railroad Administration is the lead agency for the NEPA EIS. And there are three cooperating agencies. Amtrak and New Jersey Transit are the project sponsors.

Next slide.

In terms of NEPA, John read you the statute in terms of the National Environmental Policy Act. In addition, there are several other federal laws, among others, that are very important in terms of this project. Three of them are:

Section 106 of the National Historic Preservation Act that protects historic resources on the federal level;

Section 4(f) of the U.S. DOT Act that protects what we call 4(f) resources, parklands, historic resources and wildlife refuges; and

Finally, Section 404 of the Clean Water Act, which deals with wetlands, regulated by

EPA and the Army Corps. And we will be talking about that today.

The project purpose and need.

There are four main issues in terms of the current Bridge.

We have capacity constraints and operational inflexibility;

Maintenance difficulties dealing with the existing 100-year old swing bridge mechanism;

Conflicts with maritime uses - that's the conflict between the one -- the Bridge currently is at 23 feet above mean high water and requires nearly -- more than 200 openings in a year.

And as the aging and limiting infrastructure, which basically is a two-track crossing, both of the 100-year old bridge on probably the busiest train corridor in the country.

Project goals.

We have six of these: To enhance capacity to meet current and future demand, including new service, projected out to be the full analysis year of 2030;

We want improve the service

reliability and operational flexibility;

Provide redundant Hackensack River crossing;

Minimize conflicts with maritime traffic;

Optimize existing infrastructure and planned improvements; and

Minimize impacts on the surrounding environment.

From that, we developed - and this was about a year ago - we developed a long list of alternatives. There's about thirty alternatives we originally looked at. They were grouped into four different areas.

The first group was rehabilitate the existing bridge and build a new bridge adjacent to it;

There was build two new bridges and remove the existing bridge;

There was the modify the alternative on the -- try to modify the existing bridge, maybe raise it and build a second bridge next to it; and

Then there was, again, building

two new bridges, removing the existing bridge, but do it in a phased construction.

Some of the criteria that was considered was the bridge height and maritime conflicts. And that was -- we selected two heights, one that any bridge that would be constructed, a fixed bridge would have to be fifty feet above mean high water.

And if we wanted to go down to say a 40-foot bridge, it would have to be movable. The 40-foot bridge, 40 feet above mean high water requires about -- will require only about ten openings per year. About 95, 96 percent of the ships that currently require an opening will be able to pass without an opening.

There were engineering considerations in terms of grades where the infrastructure was; availability of right-of-way, wetlands, and contaminated materials sites. And the capacity analysis itself, we said how many tracks would we need in terms of the future operations of both New Jersey Transit and Amtrak.

Four build alternatives, as John said, are in the EIS. All alternatives have

construction of two new bridges. And we will be decommissioning and doing removal of the existing Portal Bridge. And all alternatives also include a grade separation for southern -- for tracks that are coming off the Southern Bridge to be able to pass under or over the NEC to be able to get to the Morris and Essex Lines.

And this is the best way of showing it here on this schematic. It's in the EIS.

Essentially there are two bridges, the northern three-track fixed bridge, the southern two-track movable bridge, the grade separated crossing here. It's -- in this case we're showing a fly-over. Up here is the duck-under.

It allows trains on the Southern Bridge in the westbound direction to cross the Northeast corridor tracks here and to be able to get to the Morris and Essex Lines Kearny connection without requiring a crossover.

Next slide.

These are some -- and these are hard to see. And that's why we have them in the back, the alignments. But generally speaking the major difference in certain alignments -- and we

will show you right here. I can do this. It's kind of hard to see. But this is -- we have the Alternative DS in the EIS. That's the Duck-Under on the south alignment which means the second bridge would be south of the existing alignment. While when we have an E, it means on the existing line.

And so here, what's happening, you can start seeing the tracks leading to the second bridge going towards the south there off the corridor. This is the corridor. This is the northern bridge coming off to the north to approach the River. And now this is the bridge.

That's kind of southern approach. And here is the grade separated. In this case, the duck-under track will join. So two tracks will be heading towards the Bridge.

This is the Diamond Shamrock property right here. And the River is right about there.

In this case -- in this case you can see all the tracks. The southern tracks stay on the corridor. They do not go into the Diamond Shamrock property.

Basically the Northern Bridge is

in the same location but now the second bridge is on the alignment so it can stay within the corridor.

On the next slide we're going to show you, on the other side of the River, what happens when you have the different alignments.

Here is the southern alignment, the S alignment. The tracks coming off the Southern Bridge are going to be coming through the Riverbend Wetland Preserve.

And the tracks on the Northern Bridge are coming through - we'll show you in a few minutes - this is Amtrak property right here. And then there's the, what we call the Park property, which we'll get to in a few minutes to discuss what this impact is here.

And now on the existing alignment we stay -- the second bridge stays on the right-of-way, the corridor. Those are the major differences in the alignments.

Go to the next slide.

I will go through some of them quickly, the environmental effects.

We have the property impacts, cultural resources, ecological resources,

contaminated materials in section 4(f.)

First the property impacts.

Generally speaking these are the most property -- the acres of property required. The largest is the fly-over with the southern alignment, 47.8 acres. And the minimum would be under the duck-under on the existing alignment.

So you can see the S Alternative require more property because they're going to go south of the existing alignment. It allows them to be constructed at the same time but also it takes more property because they have to go off the alignment, to the south of it.

And the fly-overs requires slightly greater acreage than their respective counterpart, FE versus the DE, the FS versus the DS, because the way the fly-over works is a grade separation coming off the north end of the fly-over and it requires some more property.

But in all cases, all the alternatives - and this is really for the Northern Bridge which is the same in the alternative - require to acres of parkland here. This is a recently acquired parkland. The Hudson County Park

at Laurel Hill acquired this property recently.

The park is originally up here on the other side of the Turnpike. And then they brought this property. And we are encroaching into it because the approach of our bridges are coming right about here and then we hit a sliver of this. And that's discussed also in our 4(f) statement.

Next.

In terms of the cultural resources impact.

Obviously the first is the Portal Bridge, the decommission and removal of the Portal Bridge.

It's a national-eligible and state listed historic structure. There is the Pennsylvania Railroad Historic district which we have. By taking out the bridge and making changes to it we have an adverse effect on that.

Potential effects to the Hudson County Burial Grounds or the historic cemeteries of Hudson County which is -- we're also -- there was a re-interment that was done for the Turnpike up here not long ago in the expansion there that some of the properties that we may be in an area of sensitivity

for burial remains that are still there. That one will have to be looked at in the future with more engineering work.

And there is a Jersey City Waterworks pipeline that goes underneath the project site along Belleville Turnpike that we would have to protect from any damage during construction.

Next slide.

An area of great concern with the project is the ecological impacts and mostly in terms of the wetlands. The open water, the benthic habitat basically is the same and even to shading for most of the alternatives we're saying because these are the major structures, the major structures being the two bridges over the Hackensack River and the bridge -- also a bridge we're building over the Kearny Brackish Marsh which is between the -- just north of the project -- just north of the alignment west of the River.

Those will just be the piers. The footings would fill in this amount of benthic habitat. What happens in the wetland areas is basically the major difference between these are - and some of the largest impacts are in the east side

of the river - we would be coming across with either the northern bridges or the southern bridge's approach. One is through the Hudson County Park area and the other one is through the Riverbend Wetland Preserve.

And you can see that there is a larger impact on the southern alignments. The DS and the FS have a great impact to wetlands. And that's mostly because the southern alignment goes from the Riverbend Wetland Preserve.

Now we are looking to, as part of our analysis, to minimize these impacts. And we are looking at more structure, using structure versus fill, that we expect that these will be, when we get to do the FEIS, that these numbers will go down drastically as we build the structure throughout the wetland areas.

And here are the areas I was just talking about. You really can't see it, I'm sorry, on this map. But here again is the River. And this is the major area of wetland impacts, both on the north and the south side of the corridor.

East of the Hackensack is where most the acreage of the wetland impacts are. There

are slivers in other areas, but that's the greatest area.

The contaminated materials is another map hard to see. But basically there are several areas that are concerns with respect to contaminated materials along the corridor.

The only difference is the alternatives on the southern alignments, the DS and the FS, they run through the Diamond Shamrock property. The FEs and the DEs do not. Generally speaking most of the other impacts to any areas are the same but the alternatives.

The second 4(f) properties.

We did a 4(f) evaluation that says you cannot use a 4(f) resource, whether it's a power plant, an historic resource or wildlife refuge, unless there's no feasible and prudent alternative.

That's a section in the EIS that you can see.

And the properties that we had to examine were the Portal Bridge itself and the historic district from a historic preservation;

The park, the expanded Laurel Hill Park from the parks resources; and

The Hudson county Burial Grounds.

Finally, the agency and public participation.

We have had a series of TACs and RCLCs where we've gone over most of this information before. Just before the Draft EIS was released, we did do a briefing with the TAC and the RCLC. And we've had Section 106 consulting party meetings at the same time.

Is there anything -- I am doing the -- yes. The comment period. The comment period for this DEIS will end on March 31st.

And Maura, would you like to -- is there any information on who can comment, what's the easiest way to send them things and all?

THE MODERATOR: Yes, yes. I'll be right there.

Thank you, Robert.

Now we are going to start the public comment period of our meeting. But I just want to explain the ground rules for a moment.

Most of you have been to these before and know these ground rules well. But also, as Robert pointed out, some of these visuals were a

little difficult to see, the power points. So that's why we brought these maps in this room and in the other room. And when we're done with hearing your comments, we will -- those of us with the tags will be here and we will be happy to answer any questions for you in the open house area.

But just be reminded that any comments made in the open house area are not for the record.

The way we are going to have comments for the record is, if you would like to speak, you need to register with one of our cards at the registration area. And if you'd like to submit something in writing, we have on a comment sheet all the information about where and when to submit it along the bottom there. But you can also send us e-mail, et cetera.

And so what I'm going to ask you to do is come up to this microphone and I'll call your name in the order in which you signed up.

And if you could introduce yourself and your organization. And I'd also ask that you limit your comments to five minutes, if you will. And we will give you a little wave if you're

getting close to that.

And let me just make sure I didn't forget anything else.

Also, if you have a written copy of your statement and can give it to our stenographer, that certainly helps him as well.

So with that, I'm going to call our first speaker and that, I believe, is George Haikalis.

MR. GEORGE HAIKALIS: Good afternoon.

My name is George Haikalis and I am President of the Institute for Rational Urban Mobility, a New York city-based, not-for-profit corporation concerned with improving public transport and reducing motor vehicle congestion in dense urban areas.

I also chair the Regional Rail Working Group, a coalition of transit advocacy groups on both sides of the Hudson River.

IRUM opposes the four Portal Bridge Alternatives described in the DEIS.

The project sponsors failed to consider the options IRUM presented during the

scoping process:

(1) to permanently close the moveable bridge; and

(2) to consider routing the new Hudson River Tunnel via Hoboken.

Given the extremely limited amount of marine traffic requiring vertical clearances greater than 23 feet at this location, and because of the critical nature of this rail link for interstate commerce, it is essential that public agencies seriously consider the benefits and costs of immediately closing this swing bridge.

The risks associated with maintaining this bridge as a movable span are significant.

The Portal Bridge should be welded closed immediately. The existing marine traffic can be accommodated in low-profile vessels that can still traverse this reach.

Permanently closing the bridge also allows consideration of far less costly alternatives for expanding rail capacity across the Hackensack River. A second two-track bridge could be built immediately adjacent to the closed span,

avoiding the substantial loss of wetlands caused by building more widely-spaced spans considered in the DEIS.

Routing the new tunnel via Hoboken allows existing infrastructure to be better used.

The four-track tunnel under the Palisades and the three-track lift bridge across the Hackensack River are already in place. The four-track tunnel is only a short walk from here. And if anyone would like to see it, to see what I'm talking about, I'd be glad to take you over there.

Using these resources saves cost and completely eliminates the destruction of wetlands in the Meadowlands.

Furthermore, the awkward and time consuming loops at Secaucus need not be constructed. Commuters from Bergen and Rockland -- excuse me, commuters from Bergen and Passaic Counties would save five to ten minutes using the more direct route via Hoboken to Manhattan.

By segmenting Portal Bridge and the ARC into two separate projects, New Jersey Transit - and I might add Amtrak - has avoided consideration of a Hoboken routing. Given the

serious fiscal difficulties faced both by New Jersey and New York, it is essential that credible, cost-effective solutions be carefully considered.

IRUM recognizes the need to expand rail capacity across the Hudson and urges that New Jersey Transit and FRA and Amtrak consider alternatives that would speed completion of this expansion by using existing infrastructure and avoiding environmental concerns that could delay this vital project.

Thank you.

THE MODERATOR: Thank you, George.

And James Raleigh.

MR. JAMES RALEIGH: I'm James T. Raleigh, R-a-l-e-i-g-h.

I'm not prepared with an elegant statement like Mr. Haikalis. And so I'd like to start by questioning the whole EIS process. Because it has been my experience that you hold public hearings like this, go into secret sessions, give us a very short answer and proceed with what you've decided already to do.

I think this is a serious problem

serving the taxpayers of New Jersey, New York, Amtrak - from here to Boston and Washington. And I'd like to start with your project purpose and need.

Capacity constraints and operational inflexibility.

I see very little in this study to work on the operational inflexibility. I'm -- the next page we talk about enhanced capacity along the Northeast corridor. I see very little in this project on enhancement.

I do see some redundancy across the Hackensack River, but I seriously doubt if any of that redundancy is going to be available to Amtrak on their Washington to Boston service. You say you want to optimize existing infrastructure and planned improvements. I have yet to see that.

In looking at the Draft EIS, I am absolutely appalled at the section on safety and security. It's the same old stuff that we've always seen. We're worried about hard hats and security for the construction vehicles and so on.

I'm here to discuss something that I'm kind of reluctant to discuss in public. When

are we going to learn from 9/11? When are we going to learn we could lose a major facility in infrastructure for transportation?

We are sitting here in Jersey City. I was on the Jersey Turnpike when the Towers were hit. We lost the Path train to the World Trade Center for months. I didn't know that they were closing down the City. But I got out of my car, Military Park in Newark, and came into the Amtrak station.

It was an interesting experience to be in that station when they're trying to convince people to get back on the Metroliners, the Amtrak lines and go back to Washington telling them what happened. I see no effort in this project to improve New Jersey or New York or Amtrak in the post 9/11 environment.

I would like to be back later to make some more detailed comments.

Thank you.

THE MODERATOR: Thank you, Mr. Raleigh.

And if you will sign up again just so we can keep it in order, that would be great.

MR. JAMES RALEIGH: I will.

THE MODERATOR: And the only other person we have so far signed up is Joe Clift.

MR. JOSEPH CLIFT: If you could pull up your slide that shows the region right -- not the region, but the area right around - no - I think it's like page two in Chapter 2 where you show the river crossings. Yes. Okay.

Thank you.

Good afternoon.

My name is Joseph Clift. I'm representing the Regional Rail Working Group today. George described it earlier.

Previously I was Director of Planning and before that Director of Strategic Planning for the Long Island Railroad. And prior to that I was Manager of Operations, Planning and a strategic Planning Analyst at Conrail. I do know strategic planning.

I think this project has been very frustrating for the participants. Because unlike the claim that it is a precursor to the ARC project, it's a subsidiary to the ARC project. It started later. It gets its input from ARC. Everything is

dictated by ARC.

The fact that it claims to be separate has got to be -- it's just got to be very, very frustrating for the planner on this because they have been kept from doing things that good planners would do.

Strategic criticisms of the project.

First, Amtrak -- the only benefit Amtrak gets from this $1.2 billion, which actually bumps to probably 1.4 or 1.5 when its to year of expenditure, the only benefit Amtrak gets from this project is a bridge that's not the Portal Bridge, brand new bridge.

Everything else it tied into ARC. I call it "ARC West." Maybe 300 million of the 1.2 is directly for Amtrak. Amtrak gets no benefit from ARC. They don't have an alternative access to Penn Station. They are losing big on this. If I were at Amtrak, I would not want to spend my precious capital dollars on this.

That means that New Jersey Transit is going to have to find a billion and a half dollars to pay for this project. They can call it

not ARC, but it is part of ARC.

Secondly, the way the project is defined - and I went to the RCLC meetings - in effect, they were dictated to by ARC. They are looking at a very narrow set of options.

The four alternatives that are described, in quite excruciating detail in the DEIS, are engineering alternatives. They have no functional difference in terms of performance from the railroad operating point of view or the passengers' point of view.

It's important to do that. You normally do that in your preliminary engineering and final engineering. They're doing it in this process. But they have not looked at any other alternatives.

George Haikalis mentioned that they did not look at using existing infrastructure. It's the Lower Hack Bridge, the M&E traffic that goes across that bridge. That's a three-track bridge. It's there today. The right-of-way is there today. It varies from two to four tracks. It's all there.

We're talking about, I think,

eight acres, at a minimum, of lost wetlands and something like twenty acres of minimum disruption. Most of that disruption would be unnecessary if this project had been allowed to look at a larger world. If they were tied to ARC, they could have done that.

My argument is because they're doing this narrow look it proves that they are a subsidiary of ARC.

The two tracks move to the south side of the corridor. When this project started, the tracks were on both sides of the corridor. You had a four-track corridor that eventually split into two sets of tunnels going into New York. You had quite a bit of flexibility.

In June of last year the ARC project changed its plans and shifted to the south side and lo and behold Portal shifted to the south side. Now you have a project that will never really be able to serve an East side access project.

The trains that are on that southern track that go into the new tunnel, that go into the new station under 34th Street, are the type of equipment - diesel, dual-mode trains, they won't be able to go to Grand Central.

So you've got a project that's driven by ARC once again.

The requirement for a three-track bridge over the Hackensack for the Northeast corridor, it's not justified. They just got it from ARC. It seems if you've got two tracks coming out of a tunnel, you only need two tracks from the tunnel from New York under the Hudson River. Why do you need three tracks going across the Hackensack River? No explanation.

And last, I mentioned the cost.

And to sum up, this project has no independent utility. That means that this project -- the investment in this project should pay off with only this project happening. Most of the one-and-a-half-billion dollars is not going to pay off until ARC, which I call "Arc East," is finished. So most of this investment, with the exception of replacing the Portal Bridge, ties into ARC.

And independent utility, the concept there is you get a project together that works completely. What we have there is the ability of ARC to ignore one-and-half-billions dollars worth of cost. When they go and compete for money,

they've cut their project cost by all the things in ARC West.

And very quickly, errors in the report.

This is -- I got this from the project. This is the marine map. Thank you very much.

THE MODERATOR: You're welcome.

MR. JOSEPH CLIFT: But if you go to page -- let's see. If you go to page two. I'm sorry, let me start on 2-3, it's the project's purpose and need chapter of the DEIS, they talk about the number of trains operating across the Portal Bridge today.

There aren't 23 trains. There are 25 trains. You look at the schedules, they've missed two New Jersey Transit trains. The one I think is on the corridor, one is on the coastline. It's 25 trains in the current schedules. You can say it's 23 trains. It's not. It's 25.

And in past reports done for the ARC MIS project, they talked about thirty trains crossing the Portal Bridge going into New York without new tunnels. You should be talking about

thirty trains if you're actually true to the work that's been done in the past.

On page 2.5, the upper table says Hackensack River Bridges. They talk about the Wittpenn Bridge being 40 foot of clearance. It's 35 feet. It's in the report incorrectly.

The Path Bridge is 40 feet. And they also mention the Lower Hack which is the M&E crossing. The M&E and Montclair lines cross the Hackensack River on that bridge. It's 40 feet clearance at high tide. They said in here 11 feet.

Those are important factors to consider.

If you look at this strategically, they should -- and one of the problems we had is we kept asking about looking at something less than 50 feet for a fixed span. If you have two bridges downstream that are both railroad bridges that are movable bridges that have 40 foot clearance over the water, they should have looked. We asked them to. They said they couldn't. It's not their fault. It's the rules they were given.

If they looked at a 40-foot clearance or a 35-foot clearance, they would have

fit with the rest of the bridges across the Hackensack. All those bridges could be permanently set in their down position.

And it makes a big difference when you look at their grades. The 50-foot grade they have to go over a 50-foot bridge. They cannot get into the Kearney Yard from the Northeast corridor because it's too high. So, you know, if you had your facts straight, maybe it would have been different. I think they were just dictated to.

THE MODERATOR: Mr. Clift, excuse me. I just wonder, because we now actually have another speaker and you're beyond your limit.

MR. JOSEPH CLIFT: Okay. Thirty seconds.

THE MODERATION: But obviously you've got tons so --

MR. JOSEPH CLIFT: Yes. I'll provide prepared remarks.

THE MODERATOR: Okay. That would be very helpful.

MR. JOSEPH CLIFT: And the last is, it's page -- the environmental chapter I think makes it clear, and the presentation before makes it

clear, the minimum wetlands impact is eight acres. I think the total is somewhere around twenty if I'm correct, right? The told impact is about twenty acres. That acreage doesn't get affected. Almost none of that impact would occur if the existing infrastructure were used.

To sum up, because ARC dictated this project, it's not on its own and you couldn't look at alternatives that really made sense.

Thank you.

THE MODERATOR: Thank you, Mr. Clift. I appreciate it.

The next speaker is Jim Kirkos.

Thank you.

How are you?

MR. JIM KIRKOS: Hi. How are you?

THE MODERATOR: I am well.

MR. JIM KIRKOS: Good afternoon.

My name is Jim Kirkos and I'm the Chief Executive Officer of the Meadowlands Regional Chamber of Commerce.

The Meadowlands Regional Chamber is a proactive business service organization in Northern New Jersey. We serve member businesses and

local communities by taking leadership positions on critical issues facing the entire region.

We work not only on behalf of member firms, but for the Meadowlands community at large and the municipalities that constitute the Meadowlands Region.

And for the record I will -- I will briefly name them as:

Carlstadt;

East Rutherford;

Hasbrouck Heights;

Jersey City;

Kearny;

Little Ferry;

Lyndhurst;

Moonachie;

North Arlington;

North Bergen;

Ridgefield;

Rutherford;

Secaucus;

South Hackensack; and

Wood-Ridge.

Now, while that is typically the

case of a defined geography, we constitute the greater Meadowlands region as a much larger place, as I will get into that in my comment.

We're committed to advising public agencies on the planning process that fosters economic development with enhanced mobility leading to a better quality of life.

An example of our commitment to projects and initiatives that will shape the region's transportation infrastructure for years to come was our most recent 2007 Transportation Summit entitled: Meadowlands Mobility: An Economic Imperative.

In its context of this commitment, we are here to express our support for the Portal Bridge Capacity Enhancement Program.

The Portal Bridge Capacity Enhancement Program is of utmost importance to the Meadowlands region. The Bridge affects thousands of commuters, carrying 23 trains per hour in peak direction, 393 New Jersey Transit trains, 51 Amtrak trains every weekday.

It is a critical link in Amtrak's Northeast Corridor and New Jersey Transit's commuter

rail system that keeps the region's economy on track connecting Washington, Baltimore, Philadelphia and New Jersey with New York City.

It is this transportation system that underlies and supports the quality of residential life and the vitality of business in the greater Meadowlands communities.

In its current condition, the Portal Bridge unduly impedes reliable and effective rail traffic on the Northeast Corridor. With its mechanical and structural components prone to failure, the Bridge requires costly ongoing maintenance.

As it currently exists, the Portal Bridge has to pivot open to allow marine traffic through creating backup and delays on the most heavily used passenger rail line in the United States. The more often the swing-bridge has to pivot for marine traffic, the more likely it will malfunction and need more maintenance.

But with the near-capacity traffic over this bridge, there are few windows of opportunity for maintenance and inspection.

In sum, the availability and

reliability of rail transit is the backbone for business and commerce in the greater Meadowlands region, which is why the Chamber has publicly supported the Access to the Region's Core.

Our organization has advocated for many initiatives that appear to be out of the region itself because we are clearly conscience of the regional impacts projects such as this plays. But in order to realize the full economic potential of the Trans-Hudson Express Tunnel, we must also correct the Portal Bridge bottleneck and add extra bridge capacity in anticipation of the increased rail traffic of the two-track tunnel.

Therefore, again, the Meadowlands Regional Chamber offers its support for the Portal Bridge Capacity Enhancement Program.

Thank you.

THE MODERATOR: Thank you, Mr. Kirkos.

So for the moment that is our speakers.

Yes.

MR. JOSEPH CLIFT: Can I make one more comment?

THE MODERATOR: You may.

Could you please reintroduce yourself.

MR. JOSEPH CLIFT: Joseph Clift.

That is what happens when you don't have prepared remarks, you lose pages.

About three weeks ago I asked the Portal contact that I have about additional information on cost. If you look in Chapter 2, the next to last page, I think it is, there's one table on cost. It totals up to $1.2 billion.

I got the appendices and I looked for the cost appendix and there was not one. So I called up. I asked for it. And got three e-mails on this over the last two weeks.

And what I have been told - I'm just going to read this - I passed your inquiry onto New Jersey Transit and they have let me know that additional cost details are not available to the public at this time. I would encourage you to submit your inquiry in writing to John Wilkins, Project Manager.

And then I called up and they said that was not sufficient. And then I got a last

e-mail: Since your question is in direct response to the DEIS and in keeping with the NEPA process, the project team requests that you include your question about the budget either in writing or orally at the public hearing so that it can be entered in as an official comment on the document.

I'm doing that now.

But the simple fact is the process, as I understand it, of NEPA, is to give information to the public so they can comment.

You cannot tell from this one table how much, for instance, it cost to build the Portal Bridge and the approaches to it, how much it cost to build the bridge south of that. It's big summary numbers.

There's also no indication of how they're going to pay for this bridge. If you go to the ARC project, the cost appendix is like this. And I was not asking for additional cost information. I was asking for details on what is already there. It's available because you cannot present a summary table without the details.

And I would argue today that you're going to need to leave the record open until

you can provide those details and then give the necessary time to respond beyond that.

The idea here is to give the public information so they can comment. It hasn't been done. I know the information is there. I don't know why it hasn't been released. I asked for it three weeks ago. I would like to see it.

And as I said, I think from an FAR from a Amtrak and a Jersey Transit point of view, you would not want to have a process that was flawed by the failure to produce information that's necessary for that public comment.

Thank you.

THE MODERATOR: Thank you, Mr. Clift.

Any other speakers, if so, please sign up at the front desk?

(No response.)

THE MODERATOR: Otherwise, what I would like to do is invite you to go back into our open house, have a cookie. We are going to be repeating the presentation at 6:30. And we will be here until to 8:00 p.m.

And if you change your mind at any

time between now and 6:30 and you'd like to speak, just please fill out a registration card. And Marc is going to be here the whole evening so you can always -- we can always reopen this part of the meeting.

So thank you.

(Time noted: 5:13 p.m.)

E V E N I N G S E S S I O N

March 18, 2008

6:29 p.m.

THE MODERATOR: Okay. Good evening.

On behalf of the Federal Railroad Administration and Amtrak and New Jersey Transit, I would like to welcome you to this public hearing.

And I'm going to offer you, sir, you're the only member of the public here. And we can -- if you'd like to register to speak, we can have you fill in a speaker request card and we would be happy to hear from you.

We made a presentation. And I'm not sure, we you here earlier for the presentation?

A VOICE: No, I wasn't.

THE MODERATOR: You weren't here, okay. Then we will make the presentation again. And I will just give you a little bit of instruction to begin with and then I will introduce my colleagues to you.

But my name is Maura Fitzpatrick.

And I'm going to facilitate this hearing. And we will be here until eight p.m. tonight.

This is for the Draft Environmental Impact Statement and Draft 4(f) Evaluation for the proposed Portal Bridge Capacity Enhancement Project.

And as I had said, we are going to have a short presentation and then we will have the public comment period. And if you would like to register to speak, you need to fill in a comment card at the registration desk. And actually now we have a speaker.

And then also, we have comment sheets out in the front and it has instructions on the bottom of where you can send in your written comments. We will also accept written comments this evening. And if you have a written comment and you could give a copy to our stenographer, that's always very helpful.

But I will be coming back with some more ground rules in a moment. But right now I'm going to introduce David Valenstein from the Federal Railroad Administration.

MR. DAVID VALENSTEIN: I'm David

Valenstein from the Federal Railroad Administration. I want to welcome you here to this public hearing.

This is a bridge replacement project. It's a vital piece of the Northeast corridor and it's a very important piece of infrastructure.

The Federal Railroad Administration is the Federal lead agency for the preparation of this EIS. And we have a number of cooperating agencies, also federal agencies: The U.S. EPA, the Federal Transit Administration and the U.S. Coast Guard participating in this EIS.

The project is a joint project of Amtrak and New Kersey Transit. They are the project proponents. And a number of organizations have been formed to support the preparation of the EIS.

New Jersey Transit established a Technical Advisory Committee comprised of other agencies, federal and state agencies. And we have met with that committee a number of times, as well as with the Regional Citizens Liaison Committee throughout the study.

We are here today to listen to you if you wish to make an oral testimony, but otherwise

we will be giving a presentation.

And it gives me pleasure to introduce Ken Kulick who's representing Amtrak.

MR. KENNETH KULICK: Thank you, David. And good evening.

My name is Ken Kulick. I'm the Amtrak Engineering representative for the EIS portion of the Portal Bridge Capacity Enhancement Project.

The existing Portal Bridge, which is one hundred years old, is owned by Amtrak and it's a critical part of the Northeast corridor operations for Amtrak.

The replacement of this bridge is really important to make sure that we have a bridge that's designed to today's modern design standards and also can handle the future capacity of the increased train operations in New York City that are envisioned for the future.

I would like to introduce John Wilkins from New Jersey Transit.

MR. JOHN WILKINS: Thank you, Ken.

Good evening. I'm John Wilkins. I'm the Project Manager for New Jersey Transit.

For the record, this meeting is part of the environmental review process for the proposed Portal Bridge Capacity Enhancement Project.

The review is being conducted in accordance with the National Environmental Policy Act of 1969 better known to many people as NEPA, and the applicable regulations implementing NEPA as set forth in 40 CFR Part 1500.

A lot of words and numbers there, but it's a federal document.

Amtrak and New Jersey Transit have a team of consultants working on this project to prepare the EIS. Some of them you may have met in just being around the room and you will meet others who will make presentation this evening.

The main consultant is AKRF. Some of the sub-consultants are Gannet Fleming, Howard/Stein-Hudson, M&M, the bridge people, and most of them have representatives here tonight.

As David mentioned, there are numerous Federal, state and local agencies, with expertise in the environmental review process, that have ensured that the studies and evaluations for the EIS are in conformance with existing laws and

applicable regulations.

You the public are the essential part of this process. And we are here tonight to hear from your comments on this particular project.

We also brought a lot of materials. As you'll notice there are the schematics, the drawings, if you will, in this room. And then there are other informational items in the outer room and there are a number of things that you can pick up and take with you if you want to review them.

If you don't give us comments necessarily tonight, you do have until the 31st of this month to provide them.

For those of you who have not been to a DEIS hearing before, we are simply here tonight to hear your comments. We won't be responding. The response to the comments that we get tonight will be in the next stage of the project which is the FEIS.

So with this point, let me introduce Robert Conway who will make the presentation concerning the project.

MR. JOHN CONWAY: Thank you, John.

I'll give you a short presentation on the EIS summary.

As mentioned by some of the other speakers, the Portal Bridge is a century-old, two-track, movable swing rail bridge.

It is in the Northeast corridor. If I go to the next map, I'll be able to show you where it is. It will be easier this way.

Here's the Portal Bridge on the Hackensack River.

To the east is the Secaucus Transfer Station.

To the west down here is Newark Penn Station.

The northeast corridor runs along here.

Next slide.

Amtrak owns the Portal Bridge and most of the Northeast corridor infrastructure. Amtrak carries approximately 16,000 passengers a day on more than 100 trains in both directions while New Jersey Transit operates about 400 trains a day with 150,000 passengers.

As David said before, the FAR is

the Federal Railroad Administration, the lead federal agency for the NEPA process. And FAR oversees Amtrak's discretionary capital programs as the agency responsible for the rail transportation policy.

Amtrak and New Jersey Transit are the project sponsors. And the FTA, U.S. EPA and the U.S. Coast Guard are cooperating agencies in the EIS.

In addition to NEPA, there are several laws that play an important role in this process. Most notably is Section 106 of the National Historic Preservation Act. The bridge itself is a national eligible and state listed historic site;

Section 4(f) of the U.S. DOT Act, which protects historic resources, parkland, and wildlife refuges and wetlands under Section 404 of the Clean Water Act which is regulated by the Army Corps and the U.S. EPA.

Purpose and need, which is documented in the EIS, Chapter 1, discusses four main issues:

Capacity constraints and

operational inflexibility - the basic bottleneck we have in crossing the Hackensack River of the Northeast corridor;

Maintenance difficulties associates with the 100-year-old swing bridge;

Conflicts with maritime uses. And that has to do with the swing bridge is basically, in its closed position, is 23 feet above mean high water; and

Its aging and limited infrastructure, this 100 year old structure.

The project goals. There are project goals:

First, to enhance the capacity to meet future and current demand;

Improve the service reliability and operational inflexibility;

Provide redundant crossings over the Hackensack River;

Minimizing conflicts with maritime traffic;

Optimize existing infrastructure and planned improvements; and

Finally, minimize impacts on the

surrounding environment.

When we started this process over a year ago, we looked at approximately thirty alternatives. They were grouped in four sections.

One was originally to rehab the existing bridge and build a new bridge next to it.

Another one was to remove the existing bridge and build two bridges on each side of it.

The third group of alternatives looked at raising or modifying the existing bridge in some manner and then building a new bridge to it; and

Again, building two new bridges, except in a sequential manner: We build one bridge, take this down and then build a second on the alignment.

In considering the alternatives we looked at bridge heights and the maritime conflicts. And we determined that to meet the needs of both the maritime users and the rail traffic, that a fixed bridge, any fixed bridge would have to be at least fifty feet above mean high water. And that if we wanted to do a lower bridge, it would have to be

movable. So we had a second bridge that is 40 feet above mean high water and it's a movable lift bridge.

Engineering considerations in terms of the alignments, the grades, the profiles, that is also determined on the alignments, and a capacity analysis to determine how many tracks would we ultimately need over the water.

This resulted in four alternatives that we considered in detail in the DEIS. All alternatives include two new bridges. All alternatives also include decommission and removal of the existing Portal Bridge. And in addition, all alternatives include a grade separation from one bridge, from the tracks from the southern bridge to be able to pass under the Northeast corridor either in a fly-over or duck-under grade separation.

So they will be able to access the Morris and Essex Line's westbound connection north of the corridor.

And essentially you can see that here. Here are the two bridges, the northern three-track bridge and the southern two-track bridge.

The grade separation crossover goes from the southern bridge, crosses here to either a duck-under or fly-over. It goes here to the Morris and Essex lines, the Kearny connection westbound.

These are kind of hard to see and that's why we have some of the engineering drawings in the back.

Essentially I want to show you two things on the difference in the alignments.

West of the river we have here the difference between the southern alignment. This is DS which means duck-under south which means the second bridge is on the southern alignment.

And this is a fly-over existing where the second bridge is on the existing corridor. So the difference here is that you can see the approach.

The grade separated track here and the other track coming to the two tracks headed towards the southern bridge are headed through the Diamond Shamrock properties. This is south of the corridor, west of the river. The river is right here. This is the Diamond Shamrock property.

When we do the other alignment, the existing alignment, we do not -- the two tracks to the southern bridge remain on the right-of-way of Amtrak, on the existing right-of-way on the corridor there. They do not go into the Diamond Shamrock property.

On the east side is very similar, that on the southern alignment this is the two tracks coming off the southern bridge here and they're now coming up. They're going to come up towards Secaucus here. And they have to -- they're not on the alignment.

Here's the existing right-of-way. The existing -- this is the existing embankment. And what you see here on the existing alignment alternatives, the E Alternatives, they're here.

On the southern alignment they're down here in the Riverbend and wetland area which, as you'll see in a minute, causes -- results in some slightly increased impacts to wetlands in this area.

So I'm going to go over in terms of a summary of what's in the EIS. You have the property impacts, cultural resources, ecological resources, contaminated materials and section 4(f.)

First is the property and parkland impacts.

Generally speaking, the alternatives that require the southern alternatives, FS and DS, require more property basically on the east and west side approaches to the River because they're going to be coming -- the second bridge is not built on the alignment. It's on the south of the alignment.

So to approach that they're required to go through property outside the right-of-way.

The DE and the FE require less property, the DE the least. The duck-under on the existing alignment causes the least amount of property taking.

Here you'll see that all alternatives - and this is the approach to the northern bridge - go through a sliver of parkland.

This area here was recently acquired by Hudson County to expand Laurel Hill Park which is up here north of the Turnpike. They acquired this property between the Amtrak right-of-way and the Turnpike for an expanded park.

And because of our alignment it comes right through the -- we're coming off the River here and got a sliver, taking two acres of parkland. And all the alternatives require that sliver.

In terms of cultural resources, first off, we have the Portal Bridge, the decommissioning and removal of the Portal Bridge as an adverse effect because it's an historical resource.

We also have the Pennsylvania Railroad Historic District from Newark to New York City. The district itself is a historic resource. And due to the removal of the bridge and other elements, new elements that we were putting on the corridor, we are having adverse effect on that resource.

There is the potential to impact the historic cemeteries of Hudson County. And that's right here just north of Secaucus Station and west -- northwest of the station where the approach to the northern bridge would come in.

And in this area some work that had been done originally, disinterment and re-interment of burial remains from these cemeteries

that was done for the Turnpike extension, we may effect those area too. And it remains to be seen as more detail engineering and site-specific studies are conducted.

In terms of the ecological impacts, these are generally here. We can see the wetland impacts. The benthic habitat and open water shading impacts are generally the same for all alternatives because they're basically a function of the two bridges that cross the River and they basically have the same pier dimensions.

So you'll see in terms of the habitat at the bottom of the mud line, what we impact is nearly the same at all the open water impacts.

What's different is the difference with the lowest 8.4 acres. The up to 13.1 acres of wetlands right now is mostly on the east side of the River.

In terms of two areas, one is the northern area through Laurel Hill, expanded Laurel Hill Park. And also through, as you can see here now, let's see if I can get, this whole green area is where most of the wetland impacts occur. And the

larger amount of impacts occur with the southern alignments, the FS and DSs is because they require alignment through the Riverbend Wetland Preserve here. So that increases the wetland index by four or five acres.

But one thing we are now looking at is reducing those impacts. Because the impacts in the DEIS that have been disclosed for the whole footprint of the structure, but by limiting the amount of structure in the wetlands itself by using certain piers, we will be able to minimize the impact to a much smaller degree than what we're showing today.

In terms of contaminated materials, you really can't see this area too well. But generally speaking, there are four or five sites of concern. The most important would be the Diamond Shamrock site which is the site south, as I said before, south of the existing right-of-way that the alternatives impact the property and two don't. And so that's an important aspect in terms of that site.

And finally, the section 4(f) properties.

Certain properties are protected

under Section 4(f) of the U.S. DOT Transportation Act. These are properties that we had to examine in the EIS. There's a 4(f) Evaluation that looks at the Laurel Hill Park, the taking of the parkland, the use of the parkland, the use of the Portal Bridge and the Pennsylvania Railroad Historic District and also the Burial Grounds, the Hudson County Historic cemeteries. And these three areas that are examined in the EIS.

Essentially you cannot use these properties for transportational use unless there are no prudent feasible alternatives. And that's what the evaluation determines.

In terms of agency and public participation activities, over the past year we had several meetings with the TAC and the RCLC. Much of this was presented at the previous RCLC and TAC meetings just before the DEIS was released to the public.

We've had Section 106 meetings which is Section 106 of the National Historic Preservation Act to look at the historic resources.

And the comment period, the last line is the comment period. And that will be open

until March 31st.

And I think Maura is going to be here to take the comments.

THE MODERATOR: Thank you.

Okay. So just a couple of ground rules before we begin.

As Robert pointed out, some of the visuals were difficult to see on the power point slides. That's why we have brought these boards. And those of us with the tags will stick around after we take the public comments to answer any of your questions.

But I just want to remind you that comments made in our open house area will not be for the record.

To make comments for the record you can either request to speak this evening in front of our court reporter, or you can submit comments in writing until the 31st of March, close of business. And the information on the bottom of the comment sheet will tell you where you can submit those written comments.

So what I would like the speakers to do is, as you come up to this microphone,

introduce yourselves and your organizational affiliation. And I would like you to limit your comments to around five minutes, if you would.

And I think that's it.

So with that I'm going to reintroduce Mr. Raleigh, James T. Raleigh.

MR. JAMES RALEIGH: I'll give the other person a chance.

THE MODERATOR: Okay. We'll have to renumber them.

Jonathan Woolley.

MR. JAMES RALEIGH: I had a chance this afternoon and I'll defer to the newcomers.

MR. JONATHAN WOOLLEY: So I get to have my stage fright earlier rather than later. That's just what I needed.

Thank you very much, sir.

Jonathan Woolley. I live in Fort Lee. No particular organization at all.

The first -- the first and biggest thing that caught my attention was when I was looking through the -- as much of the DEIS as I got to look at when I printed it off the computer. And I didn't get to read the whole thing by a long shot.

The schematics - and it's the same as what's up there - the schematic do not show a connection between the westbound -- the current westbound track line, and I guess it's -- I guess it's the proposed track five, if my numbering is correct in my head here, the one that's supposed to come off the fly-over, duck-under that's going to go out onto the Morris and Essex.

At the same time, if you look at the engineering drawings on the back here, it shows there is a westbound connection -- I mean a westbound connection from the duck-under to the main line.

My first question is why is there a -- why is there a discrepancy between the two?

But my second question is, or my second comment is, in addition to wondering why the discrepancy happened in the first place, I highly recommend you build a connection from the duck-under to the main Northeast corridor in that direction. Because one of these days you're going to need the operational flexibility - even though -- even though it's proposed under the current system that all the NEC or most of the NEC trains are going to come out

of regular Penn Station. There's a couple, I believe on the Jersey Coast and the Raritan Valley that are supposed to come out of the extension there. And you're going to need the operational flexibility to change over on to the main Northeast corridor at Swift.

So I highly recommend that you do install that track.

My next comment is -- and as you can see I've got no notes here. My next comment is when we went to the hearings, the scoping meeting, which I believe was about January of 2007, if I'm not mistaken, I was one of the people - I think someone else was the other -- I was one of the people who said you ought to build more than two tracks on each of the bridges. And I said five or six.

I noticed you've now got five. I'm very glad you did. I wish it were six because for the same reasons I said a year ago, a hundred years from now you are going to need the extra right-of-way and it's better to have it now than have to go through the environmental process a hundred years from now.

So it's very important that you do have five, and I wished you had six, but five is good enough I suppose.

That's a -- that's the main part of my comments here. I may come up with some ideas later. As I say, I'm speaking off-the-cuff here.

But one thing that did cross my mind that has not been mentioned here is there's no provision in - as long as we're talking -- as long as the range of the study goes from the Secaucus Transfer Station all the way out to Kearney Interlocking there - it might have been smarter if there was a third platform on the southern side of Secaucus Transfer.

I know there's some crossing with the ARC study here. But it might have been smarter if there was a third platform on the southern part of the Secaucus Transfer rather than just an island platform for two. Because, again, it gives you the operational flexibility for future -- future increases in service, or if you just want to layover a train there.

And the other is there is no provision for a westbound waterfront connection

which would have been a good idea if you guys could put that in there, or else put it in for the proposed ARC connection from the Bergen Line up onto the westbound -- up onto the westbound line coming out of the Penn Station extension. That would allow for two-way service on the waterfront connection in the rush hour which is impossible at the current time.

So without further adieu, I'll probably end.

As far as where I thought the train -- the train line ought to -- the bridges ought to go, my gut reaction is it ought to be on the south since all the -- it would be simplest in terms of the fact that Secaucus is already -- the extension is already going to be built on the south side.

My only real reservation with that is an interesting one, is I don't really like the idea of taking any more land away from the Riverbend Wildlife Preserve than is absolutely necessary. And that's my only reservation with doing it all on the south side.

That's it. Bye.

THE MODERATOR: Thank you, Mr. Woolley. And we will be here to eight if you have other things that you want to say, by all means.

MR. JONATHAN WOOLLEY: Okay. Thanks.

THE MODERATOR: James T. Raleigh, please.

MR. JAMES RALEIGH: There are only two of us?

THE MODERATOR: There are currently only the two of you.

MR. JAMES RALEIGH: I'm James T. Raleigh.

I live in Colts Neck, Monmouth County, New Jersey.

And some people will know that I got my start in these federal EIS processes on the Monmouth/Ocean/Middlesex Rail Line. And there the problems, particularly in the 106 review between state and Federal, is far more than the attention of the -- in this -- in this particular study.

But that is one my major concerns.

In these drawings in the lobby, you have an artificial effected zone, the dotted

red, purple line, whatever it is. I think in many places that effected zone is way too small. You have the effected zone and then you have all of the wetlands. I think that more attention to whether they're really wetlands or whether they've been modified by men, mankind, particularly in the contaminated sites, may present a serious problem in going forward.

I think that we have learned from a number of other projects in the wetlands that the contaminated sites have plumes that are far bigger than a surface analysis will indicate.

The problem with the wetlands, in my opinion, is far more than the bird sanctuary. We, I think, have to look at the cumulative effect of many projects going on with rail connections.

If you take the effected area map and overlay it with the study area for the ARC Tunnel, there are any number of acres that are in common with both studies.

The problem for the Meadowlands is, in fact, worse, because from the Secaucus connection we have the connection to Xanadu and the new Giants Stadium. And when the environmentalists,

that are currently fighting the EnCap battle, see what you've done to the total wetlands with three transportation problems, you haven't heard the end of it.

Thank you.

THE MODERATOR: Thank you, Mr. Raleigh.

So, again, if there is anyone else who would like to speak.

(No response.)

THE MODERATOR: Otherwise, I will invite you to rejoin our project team at the board stations, have some more cookies, if there are any left.

Marc and I will be here till 8 if you change your mind and want to speak on the record.

And otherwise, safe travels.

(At 6:56 p.m., the hearing was temporarily recessed.)

(At 7:57 p.m., the hearing was resumed.)

THE MODERATOR: This is officially the end of the public hearing for the

Draft Environmental Impact Statement for the Portal Bridge Capacity Enhancement Project.

(At 7:57 p.m., the proceedings were concluded.)

C E R T I F I C A T I O N

STATE OF NEW YORK)
SS.
COUNTY OF NEW YORK)

I, MARC RUSSO, a Shorthand (Stenotype) Reporter and Notary Public within and for the State of New York, do hereby certify that the foregoing pages 1 through 77 taken at the time and place aforesaid, is a true and correct transcription of my shorthand notes.

IN WITNESS WHEREOF, I have hereunto set my name this 8th day of April, 2008.

_____

MARC RUSSO
